TEI Lite: Encoding for Interchange: an introduction to the TEI
Final revised edition for TEI P5
Lou Burnard  C. M. Sperberg-McQueen  August 2012
Prefatory note

TEI Lite was the name adopted for what the TEI editors originally conceived of as a simple demonstration of how the TEI (Text Encoding Initiative) encoding scheme might be adopted to meet 90% of the needs of 90% of the TEI user community. In retrospect, it was predictable that many people should imagine TEI Lite to be all there is to TEI, or find TEI Lite to be far too heavy for their needs.

The original TEI Lite (1996) was based largely on observations of existing and previous practice in the encoding of texts, particularly as manifest in the collections of the Oxford Text Archive and other collections of the period. It is therefore unsurprising that it seems to have become, if not a de facto standard, at least a common point of departure for electronic text centres and encoding projects world wide. Maybe the fact that we actually produced this shortish, readable, manual for it also helped.

Early adopters of TEI Lite included a number of Electronic Text Centers and digital library initiatives. It was adopted as the basis for some early TEI-conformant authoring systems, and as the basis for introductory tutorials, many of them in languages other than English (see further the list of legacy versions at http://www.tei-c.org/Vault/P4/Lite/).

In 2002, following the publication of TEI P4, the XML version of the TEI Guidelines, which uses the generation of TEI Lite as an example of the TEI modification mechanism, the opportunity was taken to produce a lightly revised XML-conformant version. In 2006, a more substantially revised version based on TEI P5 was produced; this reflected the many changes between TEI P4 and TEI P5, but was not otherwise significantly different. In 2012, the TEI Technical Council, decided that a final revision should be undertaken to ensure that the documentation remained consistent with the latest (2.1) release of TEI P5. This version uses a recently added mechanism in the TEI customization architecture, which permits a customization to define only the TEI elements to be included in a schema, rather than the elements to be excluded from it. As such it is probably more resilient to change than earlier versions.

Lou Burnard, August 2012
This document provides an introduction to the recommendations of the Text Encoding Initiative (TEI), by describing a specific subset of the full TEI encoding scheme. The scheme documented here can be used to encode a wide variety of commonly encountered textual features, in such a way as to maximize the usability of electronic transcriptions and to facilitate their interchange among scholars using different computer systems. It is fully compatible with the full TEI scheme, as defined by TEI document P5, *Guidelines for Electronic Text Encoding and Interchange*, as of February 2006, and available from the TEI Consortium website at [http://www.tei-c.org/](http://www.tei-c.org/).

1 Introduction

The Text Encoding Initiative (TEI) Guidelines are addressed to anyone who wants to interchange information stored in an electronic form. They emphasize the interchange of textual information, but other forms of information such as images and sound are also addressed. The Guidelines are equally applicable in the creation of new resources and in the interchange of existing ones.

The Guidelines provide a means of making explicit certain features of a text in such a way as to aid the processing of that text by computer software running on different machines. This process of making explicit we call *markup* or *encoding*. Any textual representation on a computer uses some form of markup; the TEI came into being partly because of the enormous variety of mutually incomprehensible encoding schemes currently besetting scholarship, and partly because of the expanding range of scholarly uses now being identified for texts in electronic form.

The TEI Guidelines describe an encoding scheme which can be expressed using a number of different formal languages. The first editions of the Guidelines used the *Standard Generalized Markup Language* (SGML); since 2002, this has been replaced by the use of the Extensible Markup Language (XML). These markup languages have in common the definition of text in terms of *elements* and *attributes*, and rules governing their appearance within a text. The TEI's use of XML is ambitious in its complexity and generality, but it is fundamentally no different from that of any other XML markup scheme, and so any general-purpose XML-aware software is able to process TEI-conformant texts.

Since 2001, the TEI has been a community initiative supported by an international membership consortium. It was originally an international research project sponsored by the Association for Computers and the Humanities, the Association for Computational Linguistics, and the Association for Literary and Linguistic Computing, with substantial funding over its first five years from the U.S. National Endowment for the Humanities, Directorate General XIII of the Commission of the European Communities, the Andrew W. Mellon Foundation, the Social Science and Humanities Research Council of Canada and others. The Guidelines were first published in May 1994, after six years of development involving many hundreds of scholars from different academic disciplines worldwide. During the years that followed, the Guidelines became increasingly influential in the development of the digital library, in the language industries, and even in the development of the World Wide Web itself. The TEI Consortium was set up in January 2001, and a year later produced an edition of the Guidelines entirely revised for XML compatibility. In 2004, it set about a major revision of the Guidelines to take full advantage of new schema languages, the first release of which appeared in 2005. This revision of the TEI Lite document conforms to version 2.1 of this most recent edition of the Guidelines, TEI P5, released in June 2012.

At the outset of its work, the overall goals of the TEI were defined by the closing statement of a planning conference held at Vassar College, N.Y., in November, 1987; these Poughkeepsie Principles were further elaborated in a series of design documents. The Guidelines, say these design documents, should:

- suffice to represent the textual features needed for research;
1 INTRODUCTION

- be simple, clear, and concrete;
- be easy for researchers to use without special-purpose software;
- allow the rigorous definition and efficient processing of texts;
- provide for user-defined extensions;
- conform to existing and emergent standards.

The world of scholarship is large and diverse. For the Guidelines to have wide acceptability, it was important to ensure that:

1. the common core of textual features be easily shared;
2. additional specialist features be easy to add to (or remove from) a text;
3. multiple parallel encodings of the same feature should be possible;
4. the richness of markup should be user-defined, with a very small minimal requirement;
5. adequate documentation of the text and its encoding should be provided.

The present document describes a manageable selection from the extensive set of elements and recommendations resulting from those design goals, which is called TEI Lite.

In selecting from the several hundred elements defined by the full TEI scheme, we have tried to identify a useful starter set, comprising the elements which almost every user should know about. Experience working with TEI Lite will be invaluable in understanding the full TEI scheme and in knowing how to integrate specialized parts of it into the general TEI framework.

Our goals in defining this subset may be summarized as follows:

- it should be able to handle adequately a reasonably wide variety of texts, at the level of detail found in existing practice (as demonstrated in, for example, the holdings of the Oxford Text Archive);
- it should be useful for the production of new documents (such as this one) as well as the encoding of existing texts;
- it should be usable with a wide range of existing XML software;
- it should be a pure subset of the full TEI scheme and defined using the customizaton methods described in the TEI Guidelines;
- it should be as small and simple as is consistent with the other goals.

The reader may judge our success in meeting these goals for him or herself.

Although we have tried to make this document self-contained, as suits a tutorial text, the reader should be aware that it does not cover every detail of the TEI encoding scheme. All of the elements described here are fully documented in the TEI Guidelines themselves, which should be consulted for authoritative reference information on these, and on the many others which are not described here. Some basic knowledge of XML is assumed.
2 A Short Example
We begin with a short example, intended to show what happens when a passage of prose is typed into a computer by someone with little sense of the purpose of mark-up, or the potential of electronic texts. In an ideal world, such output might be generated by a very accurate optical scanner. It attempts to be faithful to the appearance of the printed text, by retaining the original line breaks, by introducing blanks to represent the layout of the original headings and page breaks, and so forth. Where characters not available on the keyboard are needed (such as the accented letter a in fail or the long dash), it attempts to mimic their appearance.

CHAPTER 38

READER, I married him. A quiet wedding we had: he and I, the parson and clerk, were alone present. When we got back from church, I went into the kitchen of the manor-house, where Mary was cooking the dinner, and John cleaning the knives, and I said --

'Mary, I have been married to Mr Rochester this morning.' The housekeeper and her husband were of that decent, phlegmatic order of people, to whom one may at any time safely communicate a remarkable piece of news without incurring the danger of having one's ears pierced by some shrill ejaculation and subsequently stunned by a torrent of wordy wonderment. Mary did look up, and she did stare at me; the ladle with which she was basting a pair of chickens roasting at the fire, did for some three minutes hang suspended in air, and for the same space of time John's knives also had rest from the polishing process; but Mary, bending again over the roast, said only --

'Have you, miss? Well, for sure!'

A short time after she pursued, 'I seed you go out with the master, but I didn't know you were gone to church to be wed'; and she basted away. John, when I turned to him, was grinning from ear to ear.

'I telled Mary how it would be,' he said: 'I knew what Mr Edward' (John was an old servant, and had known his master when he was the cadet of the house, therefore he often gave him his Christian name) -- 'I knew what Mr Edward would do; and I was certain he would not wait long either: and he's done right, for aught I know. I wish you joy, miss!' and he politely pulled his forelock.

'Thank you, John. Mr Rochester told me to give you and Mary this.'

I put into his hand a five-pound note. Without waiting to hear more, I left the kitchen. In passing the door of that sanctum some time after, I caught the words --

'She'll happen do better for him nor ony o' t' grand ladies.' And again, 'If she ben't one o' th' handomest, she's noan faa\l, and varry good-natured; and i' his een she's fair beautiful, onybody may see that.'

I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and Mary approved the step unreservedly. Diana announced that she would just give me time to get over the honeymoon, and then she would come and see me.

'She had better not wait till then, Jane,' said Mr Rochester, when I read her letter to him; 'if she does, she will be too late, for our honey-moon will shine our life long: its beams will only fade over your grave or mine.'
How St John received the news I don't know: he never answered the letter in which I communicated it: yet six months after he wrote to me, without, however, mentioning Mr Rochester’s name or alluding to my marriage. His letter was then calm, and though very serious, kind. He has maintained a regular, though not very frequent correspondence ever since: he hopes I am happy, and trusts I am not of those who live without God in the world, and only mind earthly things.

This transcription suffers from a number of shortcomings:

- the page numbers and running titles are intermingled with the text in a way which makes it difficult for software to disentangle them;
- no distinction is made between single quotation marks and apostrophe, so it is difficult to know exactly which passages are in direct speech;
- the preservation of the copy text’s hyphenation means that simple-minded search programs will not find the broken words;
- the accented letter in faàl and the long dash have been rendered by ad hoc keying conventions which follow no standard pattern and will be processed correctly only if the transcriber remembers to mention them in the documentation;
- paragraph divisions are marked only by the use of white space, and hard carriage returns have been introduced at the end of each line. Consequently, if the size of type used to print the text changes, reformatting will be problematic.

We now present the same passage, as it might be encoded using the TEI Guidelines. As we shall see, there are many ways in which this encoding could be extended, but as a minimum, the TEI approach allows us to represent the following distinctions:

- Paragraph and chapter divisions are now marked explicitly.
- Apostrophes are distinguished from quotation marks; direct speech is explicitly marked.
- The accented letter and the long dash are correctly represented.
- Page divisions have been marked with an empty `<pb>` element alone.
- The lineation of the original has not been retained and words broken by typographic accident at the end of a line have been re-assembled without comment.
- For convenience of proof reading, a new line has been introduced at the start of each paragraph, but the indentation is removed.

```
husband were of that decent, phlegmatic order of people, to whom one may at any
time safely
communicate a remarkable piece of news without incurring the danger of having
one's ears
pierced by some shrill ejaculation and subsequently stunned by a torrent of
wonderment. Mary did look up, and she did stare at me; the ladle with which she
was basting
a pair of chickens roasting at the fire, did for some three minutes hang sus-
pended in air,
and for the same space of time John's knives also had rest from the polishing
process; but
Mary, bending again over the roast, said only —

Have you, miss? Well, for sure!

A short time after she pursued, I seed you go out with the master, but I
didn't know
you were gone to church to be wed; and she basted away. John, when I
turned to him, was
grinning from ear to ear. I told Mary how it would be, he said: I knew what Mr
Edward (John was an old servant, and had known his master when he was the
cadet of the
house, therefore he often gave him his Christian name) — I knew what Mr
Edward would do;
and I was certain he would not wait long either: and he's done right, for
aught I know. I
wish you joy, miss! and he politely pulled his forelock.

Thank you, John. Mr Rochester told me to give you and Mary this.

I put into his hand a five-pound note. Without waiting to hear more, I left the
kitchen.

In passing the door of that sanctum some time after, I caught the words —

She'll happen do better for him nor ony o' t' grand ladies. And again,
If she
ben't one o' th' handsomest, she's noan faàl, and varry good-natured; and i'
his een she's
fair beautiful, onybody may see that.

I wrote to Moor House and to Cambridge immediately, to say what I had done:
fully
explaining also why I had thus acted. Diana and Mary approved the
step
unreservedly. Diana announced that she would just give me time to get over the
honeymoon,
and then she would come and see me.

She had better not wait till then, Jane, said Mr Rochester, when I read
her letter
to him; if she does, she will be too late, for our honeymoon will shine our
life long:
its beams will only fade over your grave or mine.

How St John received the news I don't know: he never answered the letter in
which I
communicated it: yet six months after he wrote to me, without, however, mention-
ing Mr
Rochester's name or alluding to my marriage. His letter was then calm, and
though very
serious, kind. He has maintained a regular, though not very frequent correspon-
dence ever since: he hopes I am happy, and trusts I am not of those who live without God in
the world, and only mind earthly things."
3 The Structure of a TEI Text

All TEI-conformant texts contain (a) a TEI header (marked up as a `<teiHeader>` element) and (b) the transcription of the text proper (marked up as a `<text>` element). These two elements are combined together to form a single `<TEI>` element, which must be declared within the TEI namespace

The TEI header provides information analogous to that provided by the title page of a printed text. It has up to four parts: a bibliographic description of the machine-readable text, a description of the way it has been encoded, a non-bibliographic description of the text (a text profile), and a revision history. The header is described in more detail in section 19. The Electronic Title Page.

A TEI text may be unitary (a single work) or composite (a collection of single works, such as an anthology). In either case, the text may have an optional front or back. In between is the body of the text, which, in the case of a composite text, may consist of groups, each containing more groups or texts.

A unitary text will be encoded using an overall structure like this:

```
<TEI xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!-- [ TEI Header information ] -->
  </teiHeader>
  <text>
    <front>
      <!-- [ front matter ... ] -->
    </front>
    <body>
      <!-- [ body of text ... ] -->
    </body>
    <back>
      <!-- [ back matter ... ] -->
    </back>
  </text>
</TEI>
```

A composite text also has an optional front and back. In between occur one or more groups of texts, each with its own optional front and back matter. A composite text will thus be encoded using an overall structure like this:

```
<TEI xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!-- [ header information for the composite ] -->
  </teiHeader>
  <text>
    <front>
      <!-- [ front matter for the composite ] -->
    </front>
    <group>
      <text>
        <front>
          <!-- [ front matter of first text ] -->
        </front>
        <body>
          <!-- [ body of first text ] -->
        </body>
      </text>
    </group>
  </text>
</TEI>
```

---

A namespace is an XML concept. Its function is to identify the vocabulary from which a group of element names are drawn, using a standard identifier resembling a web address. The namespace for all TEI elements is http://www.tei-c.org/ns/1.0
It is also possible to define a composite of complete TEI texts, each with its own header. Such a collection is known as a *TEI corpus*, and may itself have a header:

```
<teiCorpus xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!-- header information for the corpus -->
  </teiHeader>
  <TEI>
    <teiHeader>
      <!-- header information for first text -->
    </teiHeader>
    <text>
      <!-- first text in corpus -->
    </text>
  </TEI>
  <TEI>
    <teiHeader>
      <!-- header information for second text -->
    </teiHeader>
    <text>
      <!-- second text in corpus -->
    </text>
  </TEI>
</teiCorpus>
```

It is also possible to create a composite of corpora – that is, one `<teiCorpus>` element may contain many nested `<teiCorpus>` elements rather than many nested `<TEI>` elements, to any depth considered necessary.

In the remainder of this document, we discuss chiefly simple text structures. The discussion in each case consists of a short list of relevant TEI elements with a brief definition of each, followed by definitions for any attributes specific to that element, and a reference to any classes of which the element is a member. These references are linked to full specifications for each object, as given in the TEI *Guidelines*. In most cases, short examples are also given.

For example, here are the elements discussed so far:
<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the model.resource class. Multiple <TEI> elements may be combined within a <TEI> (or <teiCorpus>) element.

<teiHeader> (TEI header) supplies descriptive and declarative metadata associated with a digital resource or set of resources.

<text> contains a single text of any kind, whether unitary or composite, for example a poem or drama, a collection of essays, a novel, a dictionary, or a corpus sample.

<teiCorpus> contains the whole of a TEI encoded corpus, comprising a single corpus header and one or more <TEI> elements, each containing a single text header and a text.

4 Encoding the Body

As indicated above, a simple TEI document at the textual level consists of the following elements:

<front> (front matter) contains any prefatory matter (headers, abstracts, title page, prefaces, dedications, etc.) found at the start of a document, before the main body.

<group> contains the body of a composite text, grouping together a sequence of distinct texts (or groups of such texts) which are regarded as a unit for some purpose, for example the collected works of an author, a sequence of prose essays, etc.

<body> (text body) contains the whole body of a single unitary text, excluding any front or back matter.

=back> (back matter) contains any appendixes, etc. following the main part of a text.

Elements specific to front and back matter are described below in section 18. Front and Back Matter. In this section we discuss the elements making up the body of a text.

4.1 Text Division Elements

The body of a prose text may be just a series of paragraphs, or these paragraphs may be grouped together into chapters, sections, subsections, etc. Each paragraph is tagged using the <p> tag. The <div> element is used to represent any such grouping of paragraphs.

<p> (paragraph) marks paragraphs in prose.

<div> (text division) contains a subdivision of the front, body, or back of a text.

The type attribute on the <div> element may be used to supply a conventional name for this category of text division, or otherwise distinguish them. Typical values might be book, chapter, section, part, poem, song, etc. For a given project, it will usually be advisable to define and adhere to a specific list of such values.

A <div> element may itself contain further, nested, <div>s, thus mimicking the traditional structure of a book, which can be decomposed hierarchically into units such as parts, containing chapters, containing sections, and so on. TEI texts in general conform to this simple hierarchic model.

The xml:id attribute may be used to supply a unique identifier for the division, which may be used for cross references or other links to it, such as a commentary, as further discussed in section 8. Cross References and Links. It is often useful to provide an xml:id attribute for every major structural unit in a text, and to derive its values in some systematic way, for example by appending a section number to a short code for the title of the work in question, as in the examples below. It is particularly useful to supply such identifiers if the resource concerned is to be made available over the web, since they make it much easier for other web-based applications to link directly to the corresponding parts of your text.

The n attribute may be used to supply (additionally or alternatively) a short mnemonic name or number for a division, or any other element. If a conventional form of reference or abbreviation for the parts of a work already exists (such as the book/chapter/verse pattern of
4 ENCODING THE BODY

Biblical citations), the \textit{n} attribute is the place to record it; unlike the identifier supplied by \textit{xml:id}, it does not need to be unique.

The \textit{xml:lang} attribute may be used to specify the language of the division. Languages are identified by an internationally defined code, as further discussed in section 6.3. \textit{Foreign Words or Expressions} below.

The \textit{rend} attribute may be used to supply information about the rendition (appearance) of a division, or any other element, as further discussed in section 6. \textit{Marking Highlighted Phrases} below. As with the \textit{type} attribute, a project will often find it useful to predefine the possible values for this attribute, but TEI Lite does not constrain it in anyway.

These four attributes, \textit{xml:id}, \textit{n}, \textit{xml:lang}, and \textit{rend} are so widely useful that they are allowed on any element in any TEI schema: they are \textit{global attributes}. Other global attributes defined in the TEI Lite scheme are discussed in section 8.3. \textit{Special kinds of Linking}.

The value of every \textit{xml:id} attribute should be unique within a document. One simple way of ensuring that this is so is to make it reflect the hierarchic structure of the document. For example, Smith’s \textit{Wealth of Nations} as first published consists of five books, each of which is divided into chapters, while some chapters are further subdivided into parts. We might define \textit{xml:id} values for this structure as follows:

\begin{verbatim}
<body>
  <div xml:id="WN1" n="I" type="book">
    <div xml:id="WN101" n="I.1" type="chapter">
      <!-- ... -->
      <div xml:id="WN102" n="I.2" type="chapter">
        <!-- ... -->
    </div>
  </div>
  <div xml:id="WN110" n="I.10" type="chapter">
    <div xml:id="WN1101" n="I.10.1" type="part">
      <!-- ... -->
    </div>
    <div xml:id="WN1102" n="I.10.2" type="part">
      <!-- ... -->
    </div>
  </div>
  <div xml:id="WN2" n="II" type="book">
    <!-- ... -->
  </div>
</body>
\end{verbatim}

A different numbering scheme may be used for \textit{xml:id} and \textit{n} attributes: this is often useful where a canonical reference scheme is used which does not tally with the structure of the work. For example, in a novel divided into books each containing chapters, where the chapters are numbered sequentially through the whole work, rather than within each book, one might use a scheme such as the following:

\begin{verbatim}
<body>
  <div xml:id="TS01" n="1" type="volume">
    <div xml:id="TS011" n="1" type="chapter">
      <!-- ... -->
    </div>
  </div>
  <div xml:id="TS02" n="2" type="volume">
    <div xml:id="TS021" n="1" type="chapter">
      <!-- ... -->
    </div>
    <div xml:id="TS022" n="2" type="chapter">
      <!-- ... -->
    </div>
  </div>
</body>
\end{verbatim}
4.2 Headings and Closings

Here the work has two volumes, each containing two chapters. The chapters are numbered conventionally 1 to 4, but the xml:id values specified allow them to be regarded additionally as if they were numbered 1.1, 1.2, 2.1, 2.2.

4.2 Headings and Closings

Every \texttt{<div>} may have a title or heading at its start, and (less commonly) a trailer such as End of Chapter 1 at its end. The following elements may be used to transcribe them:

\begin{itemize}
\item \texttt{<head>} (heading) contains any type of heading, for example the title of a section, or the heading of a list, glossary, manuscript description, etc.
\item \texttt{<trailer>} contains a closing title or footer appearing at the end of a division of a text.
\end{itemize}

Some other elements which may be necessary at the beginning or ending of text divisions are discussed below in section 18.1.2. Prefatory Matter.

Whether or not headings and trailers are included in a transcription is a matter for the individual transcriber to decide. Where a heading is completely regular (for example Chapter 1) or may be automatically constructed from attribute values (e.g. \texttt{<div type="chapter" n="1">}), it may be omitted; where it contains otherwise unrecoverable text it should always be included. For example, the start of Hardy’s \textit{Under the Greenwood Tree} might be encoded as follows:

\begin{verbatim}
<div xml:id="UGT1" n="Winter" type="Part">
  <div xml:id="UGT11" n="1" type="Chapter">
    <head>Mellstock-Lane</head>
    <p>To dwellers in a wood almost every species of tree ... </p>
  </div>
</div>
\end{verbatim}

4.3 Prose, Verse and Drama

As in the Bronte example above, the paragraphs making up a textual division are tagged with the \texttt{<p>} tag. In poetic or dramatic texts different tags are needed, to represent verse lines and stanzas in the first case, or individual speeches and stage directions in the second. :

\begin{itemize}
\item \texttt{<l>} (verse line) contains a single, possibly incomplete, line of verse.
\item \texttt{<lg>} (line group) contains one or more verse lines functioning as a formal unit, e.g. a stanza, refrain, verse paragraph, etc.
\item \texttt{<sp>} (speech) contains an individual speech in a performance text, or a passage presented as such in a prose or verse text.
\item \texttt{<speaker>} contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.
\end{itemize}
ENCODE THE BODY

<stage> (stage direction) contains any kind of stage direction within a dramatic text or fragment.

Here, for example, is the start of a poetic text in which verse lines and stanzas are tagged:

<lg n="I">
<l>I Sing the progresse of a
deathlesse soule, </l>
<l>Whom Fate, with God made, but doth not controule, </l>
<l>Plac'd in
most shapes; all times before the law </l>
<l>Yoak'd us, and when, and since, in this I
sing. </l>
<l>And the great world to his aged evening; </l>
<l>From infant morne, through manly
noone I draw. </l>
<l>What the gold Chaldee, of silver Persian saw, </l>
<l>Greeke brass, or
Roman iron, is in this one; </l>
<l>A worke t'out weare Seths pillars, bricke and
stone, </l>
<l>And (holy writs excepted) made to yeeld to none, </l>
</lg>

Note that the <lg> element marks verse lines, not typographic lines: the original lineation of the first few lines above has not therefore been made explicit by this encoding, and may be lost. The <lb> element described in section 5. Page and Line Numbers might additionally be used to mark typographic lines if so desired.

Here is the end of a famous dramatic text, in which speeches and stage directions are marked:

<sp>
<speaker>Vladimir</speaker>
<p>Pull on your trousers.</p>
</sp>
<sp>
<speaker>Estragon</speaker>
<p>Yes, let's go.</p>
</sp>
<sp>
<speaker>Vladimir</speaker>
<p>Well? Shall we go?</p>
</sp>
<sp>
<speaker>Estragon</speaker>
<p>He pulls up his trousers</p>
</sp>
<sp>
<speaker>Vladimir</speaker>
<p>They do not move.</p>
</sp>

Note that the <stage> (stage direction) element can appear either within a speech or between speeches. The <sp> ("speech") element contains, following an optional <speaker> element
indicating who is speaking, either paragraphs (if the speech is in prose) or verse lines or stanzas as in the next example. In this case, it is quite common to find that verse lines are split between speakers. The easiest way of encoding this is to use the part attribute to indicate that the lines so fragmented are incomplete:

```
<div type="Act" n="I">
  <head>ACT I</head>
  <div type="Scene" n="1">
    <head>SCENE I</head>
    <stage rend="italic">Enter Barnardo and Francisco, two Sentinels, at several doors</stage>
    <sp>
      <speaker>Barn</speaker>
      <l part="Y">Who's there?</l>
    </sp>
    <sp>
      <speaker>Fran</speaker>
      <l>Nay, answer me. Stand and unfold yourself.</l>
    </sp>
    <sp>
      <speaker>Barn</speaker>
      <l part="I">Long live the King!</l>
    </sp>
    <sp>
      <speaker>Fran</speaker>
      <l part="M">Barnardo?</l>
    </sp>
    <sp>
      <speaker>Barn</speaker>
      <l part="F">He.</l>
    </sp>
    <sp>
      <speaker>Fran</speaker>
      <l>You come most carefully upon your hour.</l>
    </sp>
  </div>
</div>

The same mechanism may be applied to stanzas which are divided between two speakers:

```
  <sp>
    <lg type="stanza" part="I">
      <l>But why drives on that ship so fast</l>
      <l>Withouten wave or wind?</l>
    </lg>
  </sp>
  <sp>
    <lg part="F">
      <l>The air is cut away before.</l>
      <l>And closes from behind.</l>
    </lg>
  </sp>
```

The `<sp>` element can also be used for dialogue presented in a prose work as if it were drama, as in the next example, which also demonstrates the use of the `who` attribute to bear a code identifying the speaker of the piece of dialogue concerned:

```xml
<div>
  <sp who="#OPI">
    <speaker>The reverend Doctor Opimian</speaker>
    <p>I do not think I have named a single unpresentable fish.</p>
  </sp>
  <sp who="#GRM">
    <speaker>Mr Gryll</speaker>
    <p>Bream, Doctor: there is not much to be said for bream.</p>
  </sp>
  <sp who="#OPI">
    <speaker>The Reverend Doctor Opimian</speaker>
    <p>On the contrary, sir, I think there is much to be said for him. In the first place....</p>
    <p>Fish, Miss Gryll -- I could discourse to you on fish by the hour: but for the present I will forbear.</p>
  </sp>
</div>
```

Here the `who` attribute values (#OPI etc.) are links, pointing to a list of the characters in the novel, each of which has an identifier:

```xml
<list>
  <head>Characters in the novel</head>
  <item xml:id="OPI">
    <name>Dr Opimian</name> : named for the famous Roman fine wine
  </item>
  <item xml:id="GRM">
    <name>Mr Gryll</name> : named for the mythical Gryllus, one of Ulysses' sailors transformed by Circe into a pig, who argues that he was happier in that state than as a man
  </item>
</list>
```

## 5 Page and Line Numbers

Page and line breaks etc. may be marked with the following elements.

- `<pb>` (page beginning) marks the beginning of a new page in a paginated document.
- `<lb>` (line beginning) marks the beginning of a new (typographic) line in some edition or version of a text.
- `<milestone>` marks a boundary point separating any kind of section of a text, typically but not necessarily indicating a point at which some part of a standard reference system changes, where the change is not represented by a structural element.

These elements mark a single point in the text, not a span of text. The global `n` attribute should be used to supply the number of the page or line beginning at the tag.

When working from a paginated original, it is often useful to record its pagination, if only to simplify later proof-reading. It is also useful for synchronizing an encoded text with a set of page images. Recording the line breaks may be useful for similar reasons.

If features such as pagination or lineation are marked for more than one edition, specify the edition in question using the `ed` attribute, and supply as many tags are necessary. For example, in the following passage we indicate where the page breaks occur in two different editions (ED1 and ED2)
I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and Mary approved the step unreservedly. Diana announced that she would just give me time to get over the honeymoon, and then she would come and see me.

A special attribute break may be used to indicate whether or not this empty element is considered as a word-breaking, irrespective of any adjacent whitespace. For example, in the following encoded sample:

The <pb> and <lb> elements are special cases of the general class of milestone elements which mark reference points within a text. The generic <milestone> element can mark any kind of reference point: for example, a column break, the start of a new kind of section not otherwise tagged, or in general any significant change in the text not marked by an XML element. The names used for types of unit and for editions referred to by the ed and unit attributes may be chosen freely, but should be documented in the header <refsDecl> element (see 19.2.3. Reference and Classification Declarations). The <milestone> element may be used to replace the others, or the others may be used as a set; they should not be mixed arbitrarily.

6 Marking Highlighted Phrases

6.1 Changes of Typeface, etc.

Highlighted words or phrases are those made visibly different from the rest of the text, typically by a change of type font, handwriting style, ink colour etc., which is intended to draw the reader’s attention to some associated change.

The global rend attribute can be attached to any element, and used wherever necessary to specify details of the highlighting used for it in the source. For example, a heading rendered in bold might be tagged <head rend="bold">, and one in italic <head rend="italic">.

The values to be used for the rend attribute are not specified by the TEI Guidelines, since they will depend entirely on the needs of the particular project. Some typical values might include italic, bold etc. for font variations; center, right etc. for alignment; large, small etc. for size; smallcaps, allcaps etc. for type variants and so on. Several such words may be used in combination as necessary, but no formal syntax is proposed. The full TEI Guidelines provide more rigorous mechanisms, using other W3C standards such as CSS, as an alternative to the use of rend.

It is not always possible or desirable to interpret the reasons for such changes of rendering in a text. In such cases, the element <hi> may be used to mark a sequence of highlighted text without making any claim as to its status.

<hi> (highlighted) marks a word or phrase as graphically distinct from the surrounding text, for reasons concerning which no claim is made.

In the following example, the use of a distinct typeface for the subheading and for the included name are recorded but not interpreted:

<hi rend="gothic">And this Indenture further witnesses</hi> that the said <hi rend="italic">Walter Shandy</hi>, merchant, in consideration of the said intended marriage ...

Alternatively, where the cause for the highlighting can be identified with confidence, a number of other, more specific, elements are available.
<emph> (emphasized) marks words or phrases which are stressed or emphasized for linguistic or rhetorical effect.

<foreign> identifies a word or phrase as belonging to some language other than that of the surrounding text.

<gloss> identifies a phrase or word used to provide a gloss or definition for some other word or phrase.

<label> contains any label or heading used to identify part of a text, typically but not exclusively in a list or glossary.

<mentioned> marks words or phrases mentioned, not used.

<term> contains a single-word, multi-word, or symbolic designation which is regarded as a technical term.

<title> contains a title for any kind of work.

Some features (notably quotations and glosses) may be found in a text either marked by highlighting, or with quotation marks. In either case, the elements <q> and <gloss> (as discussed in the following section) should be used. If the highlighting is to be recorded, use the global rend attribute.

As an example of the elements defined here, consider the following sentence:

On the one hand the Nibelungenlied is associated with the new rise of romance of twelfth-century France, the romans d’antiquité, the romances of Chrétien de Troyes, and the German adaptations of these works by Heinrich van Veldeke, Hartmann von Aue, and Wolfram von Eschenbach.

Interpreting the role of the highlighting, the sentence might look like this:

<p>On the one hand the <title>Nibelungenlied</title> is associated with the new rise of romance of twelfth-century France, the <foreign>romans d’antiquité</foreign>, the romances of Chrétien de Troyes, ...</p>

Describing only the appearance of the original, it might look like this:

<p>On the one hand the <hi rend="italic">Nibelungenlied</hi> is associated with the new rise of romance of twelfth-century France, the <hi rend="italic">romans d’antiquité</hi>, the romances of Chrétien de Troyes, ...</p>

6.2 Quotations and Related Features

Like changes of typeface, quotation marks are conventionally used to denote several different features within a text, of which the most frequent is quotation. When possible, we recommend that the underlying feature be tagged, rather than the simple fact that quotation marks appear in the text, using the following elements:

<q> (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

<mentioned> marks words or phrases mentioned, not used.

<soCalled> contains a word or phrase for which the author or narrator indicates a disclaiming of responsibility, for example by the use of scare quotes or italics.

<gloss> identifies a phrase or word used to provide a gloss or definition for some other word or phrase.
6.3 Foreign Words or Expressions

Here is a simple example of a quotation:

```xml
<p>
  Few dictionary makers are likely to forget Dr. Johnson's description of the
  lexicographer as <q>a harmless drudge.</q>
</p>
```

To record how a quotation was printed (for example, in-line or set off as a display or block quotation), the rend attribute should be used. This may also be used to indicate the kind of quotation marks used.

Direct speech interrupted by a narrator can be represented simply by ending the quotation and beginning it again after the interruption, as in the following example:

```xml
<p>
  <q>Who-e debel you?</q> — he at last said —
  <q>yoo no speak-e, damme, I kill-e.</q> And so saying, the lighted tomahawk began
  flourishing about me in the dark.
</p>
```

If it is important to convey the idea that the two <q> elements together make up a single speech, the linking attributes next and prev may be used, as described in section 8.3. Special kinds of Linking.

Quotations may be accompanied by a reference to the source or speaker, using the who attribute, whether or not this is explicit in the text, as in the following example:

```xml
<q who="#Wilson">Spaulding, he came
down into the office just this day eight weeks with this very paper in his hand,
and he
  says:—<q who="#Spaulding">I wish to the Lord, Mr. Wilson, that I was a red-headed
  man.</q>
</q>
```

This example also demonstrates how quotations may be embedded within other quotations: one speaker (Wilson) quotes another speaker (Spaulding).

The creator of the electronic text must decide whether quotation marks are replaced by the tags or whether the tags are added and the quotation marks kept. If the quotation marks are removed from the text, the rend attribute may be used to record the way in which they were rendered in the copy text.

The full TEI Guidelines provide additional elements to distinguish direct speech, quotation, and other typical uses of quotation mark although it is not always possible and may not be considered desirable to interpret the function of quotation marks in a text. For simplicity, only <q> (which may be used for any such case) has been included in TEI Lite.

6.3 Foreign Words or Expressions

Words or phrases which are not in the main language of the texts may be tagged as such in one of two ways. If the word or phrase is already tagged for some reason, the element indicated should bear a value for the global xml:lang attribute indicating the language used. Where there is no applicable element, the element <foreign> may be used, again using the xml:lang attribute. For example:

```xml
<p>John has real <foreign xml:lang="fr">savoir-faire</foreign>.</p>
<p>Have you read <title xml:lang="de">Die</title>.
```
Dreigroschenoper</p><p><em>mentioned</em> xml:lang="fr">Savoir-faire</em> is French for know-how.  
</p>The court issued a writ of <term xml:lang="la">mandamus</term>. 

As these examples show, the <foreign> element should not be used to tag foreign words if some other more specific element such as <title>, <mentioned>, or <term> applies. The global xml:lang attribute may be attached to any element to show that it uses some other language than that of the surrounding text.

The codes used to identify languages, supplied on the xml:lang attribute, must be constructed in a particular way, and must conform to common Internet standards, as further explained in the relevant section of the TEI Guidelines. Some simple example codes for a few languages are given here:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>zh</td>
<td>Chinese</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
<tr>
<td>enm</td>
<td>Middle English</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>grc</td>
<td>Ancient Greek</td>
</tr>
<tr>
<td>el</td>
<td>Greek</td>
</tr>
<tr>
<td>ja</td>
<td>Japanese</td>
</tr>
<tr>
<td>la</td>
<td>Latin</td>
</tr>
<tr>
<td>sa</td>
<td>Sanskrit</td>
</tr>
</tbody>
</table>

7 Notes

All notes, whether printed as footnotes, endnotes, marginalia, or elsewhere, should be marked using the same element:

<note> contains a note or annotation.

Where possible, the body of a note should be inserted in the text at the point at which its identifier or mark first appears. This may not be possible for example with marginalia, which may not be anchored to an exact location. For simplicity, it may be adequate to position marginal notes before the relevant paragraph or other element. Notes may also be placed in a separate division of the text (as end-notes are, in printed books) and linked to the relevant portion of the text using their target attribute.

The n attribute may be used to supply the number or identifier of a note if this is required. The resp attribute should be used consistently to distinguish between authorial and editorial notes, if the work has both kinds.

Examples:

<p>Collections are ensembles of distinct entities or objects of any sort. <note place="foot" n="1"> We explain below why we use the uncommon term <mentioned>collection</mentioned> instead of the expected <mentioned>set</mentioned>. Our usage corresponds to the <mentioned>aggregate</mentioned> of many mathematical writings and to the sense of <mentioned>class</mentioned> found in older logical writings. </note> The elements ...</p>

---

The curse is finally expiated
And now this spell was snapt: once more
I viewed the ocean green,
And looked far forth, yet little saw
Of what had else been seen

8 Cross References and Links

Explicit cross references or links from one point in a text to another in the same or another document may be encoded using the elements described in this section. Implicit links (such as the association between two parallel texts, or that between a text and its interpretation) may be encoded using the linking attributes discussed in section 8.3. Special kinds of Linking.

8.1 Simple Cross References

A cross reference from one point within a single document to another can be encoded using either of the following elements:

- `<ref>` (reference) defines a reference to another location, possibly modified by additional text or comment.
- `<ptr>` (pointer) defines a pointer to another location.

The difference between these two elements is that `<ptr>` is an empty element, simply marking a point from which a link is to be made, whereas `<ref>` may contain some text as well, typically identifying the target of the cross reference. The `<ptr>` element would be used for a cross reference which is to be indicated by some non-verbal means such as a symbol or icon, or in an electronic text by a button. It is also useful in document production systems, where the formatter can generate the correct verbal form of the cross reference.

The following two forms, for example, are logically equivalent:

See especially `<ref target="#SEC12">section 12 on page 34</ref>`.

See especially `<ptr target="#SEC12">.`.

The value of the `target` attribute on either element may be the identifier of some other element within the current document. The passage or phrase being pointed at must bear an identifier, and must therefore be tagged as an element of some kind. In the following example, the cross reference is to a `<div>` element:

... see especially `<ptr target="#SEC12">`. ...
<div xml:id="SEC12">
<head>Concerning Identifiers</head>
</div>... -->
</div>

Because the `xml:id` attribute is global, any element in a TEI document may be pointed to in this way. In the following example, a paragraph has been given an identifier so that it may be pointed at:
Sometimes the target of a cross reference does not correspond with any particular feature of a text, and so may not be tagged as an element of some kind. If the desired target is simply a point in the current document, the easiest way to mark it is by introducing an `<anchor>` element at the appropriate spot. If the target is some sequence of words not otherwise tagged, the `<seg>` element may be introduced to mark them. These two elements are described as follows:

- `<anchor>` (anchor point) attaches an identifier to a point within a text, whether or not it corresponds with a textual element.
- `<seg>` (arbitrary segment) represents any segmentation of text below the chunk level.

In the following (imaginary) example, `<ref>` elements have been used to represent points in this text which are to be linked in some way to other parts of it; in the first case to a point, and in the second, to a sequence of words:

Returning to `<ref target="#ABCD">the point where I dozed off</ref>`, I noticed that `<ref target="#EFGH">three words</ref>` had been circled in red by a previous reader.

This encoding requires that elements with the specified identifiers (ABCD and EFGH in this example) are to be found somewhere else in the current document. Assuming that no element already exists to carry these identifiers, the `<anchor>` and `<seg>` elements may be used:

```xml
....
<anchor type="bookmark" xml:id="ABCD"/> .... ....<seg type="target" xml:id="EFGH">
...</seg> ...
```

The `type` attribute should be used (as above) to distinguish amongst different purposes for which these general purpose elements might be used in a text. Some other uses are discussed in section 8.3. Special kinds of Linking below.

### 8.2 Pointing to other documents

So far, we have shown how the elements `<ptr>` and `<ref>` may be used for cross-references or links whose targets occur within the same document as their source. However, the same elements may also be used to refer to elements in any other XML document or resource, such as a document on the web, or a database component. This is possible because the value of the `target` attribute may be any valid universal resource indicator (URI) [Note: A full definition of this term, defined by the W3C (the consortium which manages the development and maintenance of the World Wide Web), is beyond the scope of this tutorial: however, the most frequently encountered version of a URI is the familiar URL used to indicate a web page, such as http://www.tei-c.org/index.xml].

A URI may reference a web page or just a part of one, for example `http://www.tei-c.org/index.xml#SEC2`. The sharp sign indicates that what follows it is the identifier of an element to be located within the XML document identified by what precedes it: this example will therefore locate an element which has an `xml:id` attribute value of SEC2 within the document retrieved from `http://www.tei-c.org/index.xml`. In the examples we have discussed so far, the part to the left of the sharp sign has been omitted: this is understood to mean that the referenced element is to be located within the current document.
Parts of an XML document can be specified by means of other more sophisticated mechanisms using a special language called Xpath, also defined by the W3C. This is particularly useful where the elements to be linked to do not bear identifiers and must therefore be located by some other means.

8.3 Special kinds of Linking

The following special purpose linking attributes are defined for every element in the TEI Lite scheme:

- **ana** links an element with its interpretation.
- **corresp** links an element with one or more other corresponding elements.
- **next** links an element to the next element in an aggregate.
- **prev** links an element to the previous element in an aggregate.

The **ana** (analysis) attribute is intended for use where a set of abstract analyses or interpretations have been defined somewhere within a document, as further discussed in section 15. Interpretation and Analysis. For example, a linguistic analysis of the sentence John loves Nancy might be encoded as follows:

```xml
<seg type="sentence" ana="SVO">
  <seg type="lex" ana="#NP1">John</seg>
  <seg type="lex" ana="#VVI">loves</seg>
  <seg type="lex" ana="#NP1">Nancy</seg>
</seg>
```

This encoding implies the existence elsewhere in the document of elements with identifiers SVO, NP1, and VV1 where the significance of these particular codes is explained. Note the use of the `<seg>` element to mark particular components of the analysis, distinguished by the `type` attribute.

The **corresp** (corresponding) attribute provides a simple way of representing some form of correspondence between two elements in a text. For example, in a multilingual text, it may be used to link translation equivalents, as in the following example:

```xml
<seg xml:lang="fr" xml:id="FR1" corresp="#EN1">Jean aime Nancy</seg>
<seg xml:lang="en" xml:id="EN1" corresp="#FR1">John loves Nancy</seg>
```

The same mechanism may be used for a variety of purposes. In the following example, it has been used to represent the correspondences between the show and Shirley, and between NBC and the network:

```xml
<p>
  <title xml:id="shirley">Shirley</title>, which made its Friday night debut only a month ago, was not listed on <name xml:id="nbc">NBC</name>’s new schedule, although <seg xml:id="network" corresp="#nbc">the network</seg> says <seg xml:id="show" corresp="#shirley">the show</seg> still is being considered.
</p>
```
The next and prev attributes provide a simple way of linking together the components of a discontinuous element, as in the following example:

```xml
<q xml:id="Q1a" next="#Q1b">Who-e debel you?</q> — he at last said — <q xml:id="Q1b" prev="#Q1a">you no speak-e, damme, I kill-e.</q>
And so saying, the lighted tomahawk began flourishing about me in the dark.
```

9 Editorial Interventions

The process of encoding an electronic text has much in common with the process of editing a manuscript or other text for printed publication. In either case a conscientious editor may wish to record both the original state of the source and any editorial correction or other change made in it. The elements discussed in this and the next section provide some facilities for meeting these needs.

9.1 Correction and Normalization

The following elements may be used to mark correction, that is editorial changes introduced where the editor believes the original to be erroneous:

- `<corr>` (correction) contains the correct form of a passage apparently erroneous in the copy text.
- `<sic>` (Latin for thus or so) contains text reproduced although apparently incorrect or inaccurate.

The following elements may be used to mark normalization, that is editorial changes introduced for the sake of consistency or modernization of a text:

- `<orig>` (original form) contains a reading which is marked as following the original, rather than being normalized or corrected.
- `<reg>` (regularization) contains a reading which has been regularized or normalized in some sense.

As an example, consider this extract from the quarto printing of Shakespeare’s *Henry V*:

... for his nose was as sharp as a pen and a table of green feelds

A modern editor might wish to make a number of interventions here, specifically to modernize (or normalize) the Elizabethan spellings of *a‘* and *feelds* for *he* and *fields* respectively. He or she might also want to emend *table* to *babbl’d*, following an editorial tradition that goes back to the 18th century Shakespearian scholar Lewis Theobald. The following encoding would then be appropriate:

... for his nose was as sharp as a pen and <reg>he</reg>
<corr resp="#Theobald">babbl’d</corr> of green <reg>fields</reg>

A more conservative or source-oriented editor, however, might want to retain the original, but at the same time signal that some of the readings it contains are in some sense anomalous:

... for his nose was as sharp as a pen and <orig>a</orig>
<sic>table</sic> of green <orig>feelds</orig>
Finally, a modern digital editor may decide to combine both possibilities in a single composite text, using the `<choice>` element.

`<choice>` groups a number of alternative encodings for the same point in a text. This allows an editor to mark where alternative readings are possible:

```
... for his nose was as sharp as a pen and
<choice>
  <orig>a</orig>
  <reg>he</reg>
</choice>
<choice>
  <corr resp="#Theobald">babbl\'d</corr>
  <sic>table</sic>
</choice> of green
<choice>
  <orig>feelds</orig>
  <reg>fields</reg>
</choice>
```

## 9.2 Omissions, Deletions, and Additions

In addition to correcting or normalizing words and phrases, editors and transcribers may also supply missing material, omit material, or transcribe material deleted or crossed out in the source. In addition, some material may be particularly hard to transcribe because it is hard to make out on the page. The following elements may be used to record such phenomena:

- `<add>` (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector.
- `<gap>` indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible.
- `<del>` (deletion) contains a letter, word, or passage deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, or a previous annotator or corrector.
- `<unclear>` contains a word, phrase, or passage which cannot be transcribed with certainty because it is illegible or inaudible in the source.

These elements may be used to record changes made by an editor, by the transcriber, or (in manuscript material) by the author or scribe. For example, if the source for an electronic text read The following elements are provided for simple editorial interventions. then it might be felt desirable to correct the obvious error, but at the same time to record the deletion of the superfluous second *for*, thus:

```
The following elements are provided for `<del resp="#LB">for</del>` simple editorial interventions.
```

The attribute value `#LB` on the *resp* attribute is used to point to a fuller definition (typically in a `<respStmt>` element) for the agency responsible for correcting the duplication of *for*.

If the source read The following elements provided for simple editorial interventions. (i.e. if the verb had been inadvertently dropped) then the corrected text might read:

```
The following elements `<add resp="#LB">are</add>` provided for simple editorial interventions.
```
These elements are also used to record authorial changes in manuscripts. A manuscript in which the author has first written How it galls me, what a galling shadow, then crossed out the word galls and inserted dogs might be encoded thus:

```
How it <del hand="#DHL" type="overstrike">galls</del>
<add hand="#DHL" place="supralinear">dogs</add> me, what a galling shadow
```

Again, the code #DHL points to another location where more information about the hand concerned is to be found.

Similarly, the `<unclear>` and `<gap>` elements may be used together to indicate the omission of illegible material; the following example also shows the use of `<add>` for a conjectural emendation:

```
One hundred & twenty good regulars joined to me <unclear>
<gap reason="indecipherable"/>
</unclear>
& instantly, would aid me signally <add hand="#ed">in?</add> an enterprise against Wilmington.
```

The `<del>` element marks material which has been transcribed as part of the electronic text despite being marked as deleted, while `<gap>` marks the location of material which is omitted from the electronic text, whether it is legible or not. A language corpus, for example, might omit long quotations in foreign languages:

```
... An example of a list appearing in a fief ledger of <name type="place">Koldinghus</name>
<date>1611/12</date> is given below. It shows cash income from a sale of honey. <p>
<gap>
<desc>quotation from ledger (in Danish)</desc>
</gap>
<p>A description of the overall structure of the account is once again ...
```

Other corpora (particular those constructed before the widespread use of scanners) systematically omit figures and mathematics:

```
At the bottom of your screen below the mode line is the <term>minibuffer</term>. This is the area where Emacs echoes the commands you enter and where you specify filenames for Emacs to find, values for search and replace, and so on. <gap reason="graphic">
<desc>diagram of Emacs screen</desc>
</gap>
```

The full TEI scheme provides more precise ways of capturing different aspects of a transcription, distinguishing for example between text added or supplied by the encoder and text indicated as supplied or deleted in the source. TEI Lite does not provide different tags for these purposes.

---

3The full TEI provides a range of elements for encoding metadata about manuscript production and description, which are not however included in TEI Lite
9.3 Abbreviations and their Expansion

Like names, dates, and numbers, abbreviations may be transcribed as they stand or expanded; they may be left unmarked, or encoded using the following elements:

- `<abbr>` (abbreviation) contains an abbreviation of any sort.
- `<expan>` (expansion) contains the expansion of an abbreviation.

The `<abbr>` element is useful as a means of distinguishing semi-lexical items such as acronyms or jargon:

```
We can sum up the above discussion as follows: the identity of a `<abbr>`CC</abbr> is defined by that calibration of values which motivates the elements of its `<abbr>`GSP</abbr>;
```

Every manufacturer of `<abbr>`3GL</abbr> or `<abbr>`4GL</abbr> languages is currently nailing on `<abbr>`OOP</abbr>` extensions

The `type` attribute may be used to distinguish types of abbreviation by their function.

The `<expan>` element is used to mark an expansion supplied by an encoder. This element is particularly useful in the transcription of manuscript materials. For example, the character p with a bar through its descender as a conventional representation for the word per is commonly encountered in Medieval European manuscripts. An encoder may choose to expand this as follows:

```
<expan>per</expan>
```

The expansion corresponding with an abbreviated form may not always contain the same letters as the abbreviation. Where it does, however, common editorial practice is to italicize or otherwise signal which letters have been supplied. The `<expan>` element should not be used for this purpose since its function is to indicate an expanded form, not a part of one. For example, consider the common abbreviation wt (for with) found in medieval texts. In a modern edition, an editor might wish to represent this as `w<hi rend="it">i</hi>t<hi rend="it">h</hi>`.

```
<expan>\w<hi rend="it">i</hi>t<hi rend="it">h</hi></expan>
```

The full TEI also provides elements `<ex>` and `<am>` for use in this situation, but these are not included in the TEI Lite schema.

To record both an abbreviation and its expansion, the `<choice>` element mentioned above may be used to group the abbreviated form with its proposed expansion:

```
<choice>
  <abbr>wt</abbr>
  <expan>with</expan>
</choice>
```

10 Names, Dates, and Numbers

The TEI scheme defines elements for a large number of data-like features which may appear almost anywhere within almost any kind of text. These features may be of particular interest.
in a range of disciplines; they all relate to objects external to the text itself, such as the names of persons and places, numbers and dates. They also pose particular problems for many natural language processing (NLP) applications because of the variety of ways in which they may be presented within a text. The elements described here, by making such features explicit, reduce the complexity of processing texts containing them.

10.1 Names and Referring Strings

A referring string is a phrase which refers to some person, place, object, etc. Two elements are provided to mark such strings:

<rs> (referencing string) contains a general purpose name or referring string.
<name> (name, proper noun) contains a proper noun or noun phrase.

The type attribute is used to distinguish amongst (for example) names of persons, places and organizations, where this is possible:

```
<q>My dear <rs type="person">Mr. Bennet</rs>, said his lady to him one day,
<q>have you heard that <rs type="place">Netherfield Park</rs> is let at last?</q>
```

It being one of the principles of the <rs type="organization">Circumlocution Office</rs> never, on any account whatsoever, to give a straightforward answer, <rs type="person">Mr Barnacle</rs> said,

```
<q>Possibly.</q>
```

As the following example shows, the <rs> element may be used for any reference to a person, place, etc, not necessarily one in the form of a proper noun or noun phrase.

```
<q>My dear <rs type="person">Mr. Bennet</rs>, said <rs type="person">his lady</rs> to him one day...
```

The <name> element by contrast is provided for the special case of referencing strings which consist only of proper nouns; it may be used synonymously with the <rs> element, or nested within it if a referring string contains a mixture of common and proper nouns.

Simply tagging something as a name is rarely enough to enable automatic processing of personal names into the canonical forms usually required for reference purposes. The name as it appears in the text may be inconsistently spelled, partial, or vague. Moreover, name prefixes such as van or de la, may or may not be included as part of the reference form of a name, depending on the language and country of origin of the bearer.

The key attribute provides an alternative normalized identifier for the object being named, like a database record key. It may thus be useful as a means of gathering together all references to the same individual or location scattered throughout a document:

```
<q>My dear <rs type="person" key="BENM1">Mr. Bennet</rs>, said <rs type="person" key="BENM2">his lady</rs> to him one day,
<q>have you heard that <rs type="place" key="NETP1">Netherfield Park</rs> is let at last?</q>
```

This use should be distinguished from the case of the <reg> (regularization) element, which provides a means of marking the standard form of a referencing string as demonstrated below:
10.2 Dates and Times

Tags for the more detailed encoding of times and dates include the following:

- **<date>** contains a date in any format.
- **<time>** contains a phrase defining a time of day in any format.

These elements have a number of attributes which can be used to provide normalised versions of their values.

- **att.datable** provides attributes for normalization of elements that contain dates, times, or datable events.
  - **@period** supplies a pointer to some location defining a named period of time within which the datable item is understood to have occurred.
  - **@when [att.datable.w3c]** supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.

The **when** attribute specifies a normalized form for the date or time, using one of the standard formats defined by ISO 8601. Partial dates or times (e.g. 1990, September 1990, twelvish) can be expressed by omitting a part of the value supplied, as in the following examples:

```
<date when="1980-02-21">21 Feb 1980</date>
<date when="1990">1990</date>
<date when="1990-09">September 1990</date>
<date when="--09">September</date>
<date when="2001-09-11T12:48:00">Sept 11th, 12 minutes before 9 am</date>
```
Note in the last example the use of a normalized representation for the date string which includes a time: this example could thus equally well be tagged using the `<time>` element.

Given on the `<date` when="1977-06-12">Twelfth Day of June in the Year of Our Lord One Thousand Nine Hundred and Seventy-seven of the Republic the Two Hundredth and first and of the University the Eighty-Sixth.</`date`

<specially when it's nine below zero</s>
<and `time` when="15:00:00">three o'clock in the afternoon</time>
</l>

10.3 Numbers
Numbers can be written with either letters or digits (twenty-one, xxi, and 21) and their presentation is language-dependent (e.g. English 5th becomes Greek 5; English 123,456.78 equals French 123.456,78). In natural-language processing or machine-translation applications, it is often helpful to distinguish them from other, more lexical parts of the text. In other applications, the ability to record a number’s value in standard notation is important. The `<num>` element provides this possibility:

`<num>` (number) contains a number, written in any form.

For example:

```xml
<num value="33">xxxiii</num>
<num type="cardinal" value="21">twenty-one</num>
<num type="percentage" value="10">ten percent</num>
<num type="percentage" value="10">10%</num>
<num type="ordinal" value="5">5th</num>
```

11 Lists
The element `<list>` is used to mark any kind of list. A list is a sequence of text items, which may be numbered, bulleted, or arranged as a glossary list. Each item may be preceded by an item label (in a glossary list, this label is the term being defined):

`<list>` contains any sequence of items organized as a list.
`<item>` contains one component of a list.
`<label>` contains any label or heading used to identify part of a text, typically but not exclusively in a list or glossary.

Individual list items are tagged with `<item>`. The first `<item>` may optionally be preceded by a `<head>`, which gives a heading for the list. The numbering of a list may be omitted, indicated using the `n` attribute on each item, or (rarely) tagged as content using the `<label>` element. The following are all thus equivalent:

```xml
<list>
  <head>A short list</head>
  <item>First item in list.</item>
  <item>Second item in list.</item>
  <item>Third item in list.</item>
</list>
<list>
  <head>A short list</head>
  <item n="1">First item in list.</item>
```
The styles should not be mixed in the same list.

A simple two-column table may be treated as a glossary list, tagged `<list type="gloss">`. Here, each item comprises a `term` and a `gloss`, marked with `<label>` and `<item>` respectively. These correspond to the elements `<term>` and `<gloss>`, which can occur anywhere in prose text.

Where the internal structure of a list item is more complex, it may be preferable to regard the list as a `table`, for which special-purpose tagging is defined below (13. Tables).

Lists of whatever kind can, of course, nest within list items to any depth required. Here, for example, a glossary list contains two items, each of which is itself a simple list:
<item>I am singled out and separated as it were from all the world to be miserable.</item>
<item>I am divided from mankind — a solitaire; one banished from human society.</item>
</list>
<label>GOOD</label>

A list need not necessarily be displayed in list format. For example,

<p>On those remote pages it is written that animals are divided into <list rend="run-on">
<item>n="a">those that belong to the Emperor,</item>
<item>n="b"> embalmed ones, </item>
<item>n="c"> those that are trained, </item>
<item>n="d"> suckling pigs, </item>
<item>n="e"> mermaids, </item>
<item>n="f"> fabulous ones, </item>
<item>n="g"> stray dogs, </item>
<item>n="h"> those that are included in this classification, </item>
<item>n="i"> those that tremble as if they were mad, </item>
<item>n="j"> innumerable ones, </item>
<item>n="k"> those drawn with a very fine camel's-hair brush, </item>
<item>n="l"> others, </item>
<item>n="m"> those that have just broken a flower vase, </item>
<item>n="n"> those that resemble flies from a distance.</item>
</list></p>

Lists of bibliographic items should be tagged using the <listBibl> element, described in the next section.

12 Bibliographic Citations

It is often useful to distinguish bibliographic citations where they occur within texts being transcribed for research, if only so that they will be properly formatted when the text is printed out. The element <bibl> is provided for this purpose. Where the components of a bibliographic reference are to be distinguished, the following elements may be used as appropriate. It is generally useful to mark at least those parts (such as the titles of articles, books, and journals) which will need special formatting. The other elements are provided for cases where particular interest attaches to such details.

<bibl> (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.

<author> in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority.
<biblScope> (scope of bibliographic reference) defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.
<date> contains a date in any format.
<editor> contains a secondary statement of responsibility for a bibliographic item, for example the name of an individual, institution or organization, (or of several such) acting as editor, compiler, translator, etc.
<publisher> provides the name of the organization responsible for the publication or distribution of a bibliographic item.
<pubPlace> (publication place) contains the name of the place where a bibliographic item was published.
<title> contains a title for any kind of work.

For example, the following editorial note might be transcribed as shown:

He was a member of Parliament for Warwickshire in 1445, and died March 14, 1470 (according to Kittredge, Harvard Studies 5. 88ff).

For lists of bibliographic citations, the <listBibl> element should be used; it may contain a series of <bibl> elements.

13 Tables
Tables represent a challenge for any text processing system, but simple tables, at least, appear in so many texts that even in the simplified TEI tag set presented here, markup for tables is necessary. The following elements are provided for this purpose:
<table> contains text displayed in tabular form, in rows and columns.
<row> contains one row of a table.
<cell> contains one cell of a table.

For example, Defoe uses mortality tables like the following in the Journal of the Plague Year to show the rise and ebb of the epidemic:

<p>It was indeed coming on amain, for the burials that same week were in the next adjoining parishes thus:— <table rows="5" cols="4">
  <row role="data">
    <cell role="label">St. Leonard's, Shoreditch</cell>
    <cell>64</cell>
    <cell>84</cell>
    <cell>119</cell>
  </row>
  <row role="data">
    <cell role="label">St. Botolph's, Bishopsgate</cell>
    <cell>65</cell>
    <cell>105</cell>
    <cell>116</cell>
  </row>
  <row role="data">
    <cell role="label">St. Giles's, Cripplegate</cell>
    <cell>31</cell>
  </row>
</table>
This shutting up of houses was at first counted a very cruel and unchristian method, and the poor people so confined made bitter lamentations. ... 

14 Figures and Graphics

Not all the components of a document are necessarily textual. The most straightforward text will often contain diagrams or illustrations, to say nothing of documents in which image and text are inextricably intertwined, or electronic resources in which the two are complementary.

The encoder may simply record the presence of a graphic within the text, possibly with a brief description of its content, and may also provide a link to a digitized version of the graphic, using the following elements:

- `<graphic>` indicates the location of a graphic or illustration, either forming part of a text, or providing an image of it.
- `<figure>` groups elements representing or containing graphic information such as an illustration, formula, or figure.
- `<figDesc>` (description of figure) contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

Any textual information accompanying the graphic, such as a heading and/or caption, may be included within the `<figure>` element itself, in a `<head>` and one or more `<p>` elements, as also may any text appearing within the graphic itself. It is strongly recommended that a prose description of the image be supplied, as the content of a `<figDesc>` element, for the use of applications which are not able to render the graphic, and to render the document accessible to vision-impaired readers. (Such text is not normally considered part of the document proper.)

The simplest use for these elements is to mark the position of a graphic and provide a link to it, as in this example:

```
<pb n="412"/>
<figure>
  <graphic url="p412fig.png"/>
</figure>
<pb n="413"/>
```

This indicates that the graphic contained by the file p412fig.png appears between pages 412 and 413.

The `<graphic>` element can appear anywhere that textual content is permitted, within but not between paragraphs or headings. In the following example, the encoder has decided to treat a specific printer’s ornament as a heading:

```
<head>
  <graphic url="http://www.iath.virginia.edu/gants/Ornaments/Heads/hp-ral02.gif"/>
</head>
```

More usually, a graphic will have at least an identifying title, which may be encoded using the `<head>` element, or a number of figures may be grouped together in a particular structure. It is also often convenient to include a brief description of the image. The `<figure>` element provides a means of wrapping one or more such elements together as a kind of graphic block:
These cases should be carefully distinguished from the case where an encoded text is complemented by a collection of digital images, maintained as a distinct resource. The facs attribute may be used to associate any element in an encoded text with a digital facsimile of it. In the simple case where only page images are available, the facs attribute on the `<pb>` element may be used to associate each image with an appropriate point in the text:

```xml
<text>
  <pb facs="page1.png" n="1"/>
  <!-- text contained on page 1 is encoded here -->
  <pb facs="page2.png" n="2"/>
  <!-- text contained on page 2 is encoded here -->
</text>
```

This method is only appropriate in the simple case where each digital image file `page1.png` etc. corresponds with a single transcribed and encoded page. If more detailed alignment of image and transcription is required, for example because the image files actually represent double page spreads, more sophisticated mechanisms are provided in the full TEI Guidelines.

## 15 Interpretation and Analysis

It is often said that all markup is a form of interpretation or analysis. While it is certainly difficult, and may be impossible, to distinguish firmly between objective and subjective information in any universal way, it remains true that judgments concerning the latter are typically regarded as more likely to provide controversy than those concerning the former. Many scholars therefore prefer to record such interpretations only if it is possible to alert the reader that they are considered more open to dispute, than the rest of the markup. This section describes some of the elements provided by the TEI scheme to meet this need.

### 15.1 Orthographic Sentences

Interpretation typically ranges across the whole of a text, with no particular respect to other structural units. A useful preliminary to intensive interpretation is therefore to segment the text into discrete and identifiable units, each of which can then bear a label for use as a sort of canonical reference. To facilitate such uses, these units may not cross each other, nor nest within each other. They may conveniently be represented using the following element: `<s>` (s-unit) contains a sentence-like division of a text.

As the name suggests, the `<s>` element is most commonly used (in linguistic applications at least) for marking orthographic sentences, that is, units defined by orthographic features such as punctuation. For example, the passage from *Jane Eyre* discussed earlier might be divided into s-units as follows:

```xml
<pb n="474"/>
<div type="chapter" n="38">
  <p>
    <s n="001">Reader, I married him.</s>
    <s n="002">A quiet wedding we had:</s>
    <s n="003">he</s>
  </p>
</div>
```
and I, the parson and clerk, were alone present.</p>
</div>

When we got back from church, I went into the kitchen of the manor-house, where Mary was cooking the dinner, and John cleaning the knives, and I said —

Mary, I have been married to Mr Rochester this morning.</p>

Notethat elements cannot nest: the beginning of one element implies that the previous one has finished. When s-units are tagged as shown above, it is advisable to tag the entire text end-to-end, so that every word in the text being analysed will be contained by exactly one element, whose identifier can then be used to specify a unique reference for it. If the identifiers used are unique within the document, then the xml:id attribute might be used in preference to the n used in the above example.

15.2 Words and punctuation

Tokenization, that is, the identification of lexical or non-lexical tokens within a text, is a very common requirement for all kinds of textual analysis, and not an entirely trivial one. The decision as to whether, for example, can’t in English or du in French should be treated as one word or two is not simple. Consequently it is often useful to make explicit the preferred tokenization in a marked up text. The following elements are available for this purpose:

<w> (word) represents a grammatical (not necessarily orthographic) word.

<pc> (punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark.

For example, the output from a part of speech tagger might be recorded in TEI Lite as follows:

In this example, each word has been decorated with an automatically generated part of speech code, using the ana attribute discussed in section §8.3. Special kinds of Linking above. The <w> also provides for each word to be associated with a root form or lemma, either explicitly using the lemma attribute, or by reference, using the lemmaRef attribute, as in this example:

...<w ana="#VBD" lemma="be" lemmaRef="http://www.myLexicon.com/be">was</w> ...

15.3 General-Purpose Interpretation Elements

The <w> element is a specialisation of the <seg> element which has already been introduced for use in identifying otherwise unmarked targets of cross references and hypertext links (see section §8. Cross References and Links); it identifies some phrase-level portion of text to which
the encoder may assign a user-specified type, as well as a unique identifier; it may thus be used to tag textual features for which there is no other provision in the published TEI Guidelines.

For example, the Guidelines provide no apostrophe element to mark parts of a literary text in which the narrator addresses the reader (or hearer) directly. One approach might be to regard these as instances of the <q> element, distinguished from others by an appropriate value for the who attribute. A possibly simpler, and certainly more general, solution would however be to use the <seg> element as follows:

```xml
<div type="chapter" n="38">
  <p>
    <seg type="apostrophe">Reader, I married him.</seg> A quiet wedding we had:
    ...
  </p>
</div>
```

The type attribute on the <seg> element can take any value, and so can be used to record phrase-level phenomena of any kind; it is good practice to record the values used and their significance in the header.

A <seg> element of one type (unlike the <s> element which it superficially resembles) can be nested within a <seg> element of the same or another type. This enables quite complex structures to be represented; some examples were given in section 8.3. Special kinds of Linking above. However, because it must respect the requirement that elements be properly nested and may not cut across each other, it cannot cope with the common requirement to associate an interpretation with arbitrary segments of a text which may completely ignore the document hierarchy. It also requires that the interpretation itself be represented by a single coded value in the type attribute.

Neither restriction applies to the <interp> element, which provides powerful features for the encoding of quite complex interpretive information in a relatively straightforward manner. <interp> (interpretation) summarizes a specific interpretative annotation which can be linked to a span of text.

<interpGrp> (interpretation group) collects together a set of related interpretations which share responsibility or type.

These elements allow the encoder to specify both the class of an interpretation, and the particular instance of that class which the interpretation involves. Thus, whereas with <seg> one can say simply that something is an apostrophe, with <interp> one can say that it is an instance (apostrophe) of a larger class (rhetorical figures).

Moreover, <interp> is a stand off element: it does not surround the segments of text which it describes, but instead is linked to the passage in question either by means of the ana attribute discussed in section 8.3. Special kinds of Linking above, or by means of its own inst attribute. This means that any kind of analysis can be represented, independently of the document hierarchy, as well as facilitating the grouping of analyses of a particular type together. A special purpose <interpGrp> element is provided for the latter purpose.

For example, suppose that you wish to mark such diverse aspects of a text as themes or subject matter, rhetorical figures, and the locations of individual scenes of the narrative. Different portions of our sample passage from Jane Eyre for example, might be associated with the rhetorical figures of apostrophe, hyperbole, and metaphor; with subject-matter references to churches, servants, cooking, postal service, and honeymoons; and with scenes located in the church, in the kitchen, and in an unspecified location (drawing room?).

These interpretations could be placed anywhere within the <text> element; it is however good practice to put them all in the same place (e.g. a separate section of the front or back matter), as in the following example:
The evident redundancy of this encoding can be considerably reduced by using the <interp-Grp> element to group together all those <interp> elements which share common attribute values, as follows:

Once these interpretation elements have been defined, they can be linked with the parts of the text to which they apply in either or both of two ways. The ana attribute can be used on whichever element is appropriate:
Note in this example that since the paragraph has two settings (in the church and in the kitchen),
the identifiers of both have been supplied.

Alternatively, the <interp> elements can point to all the parts of the text to which they
apply, using their inst attribute:

```xml
<interp xml:id="fig-aapos-2" type="figureOfSpeech" resp="#LB-MSM" inst="#P38.1.1">apostrophe</interp>
<interp xml:id="set-church-2" type="scene-setting" inst="#P38.1" resp="#LB-MSM">church</interp>
<interp xml:id="set-kitchen-2" type="scene-setting" inst="#P38.1" resp="#LB-MSM">kitchen</interp>
```

The <interp> element is not limited to any particular type of analysis. The literary analysis
shown above is but one possibility; one could equally well use <interp> to capture a linguistic
part-of-speech analysis. For example, the example sentence given in section 8.3. Special kinds
of Linking assumes a linguistic analysis which might be represented as follows:

```xml
<interp xml:id="NP1" type="pos">noun phrase, singular</interp>
<interp xml:id="VV1" type="pos">inflected verb, present-tense singular</interp> ...
```

## 16 Technical Documentation

Although the focus of this document is on the use of the TEI scheme for the encoding of existing
pre-electronic documents, the same scheme may also be used for the encoding of new documents.
In the preparation of new documents (such as this one), XML has much to recommend it: the
document’s structure can be clearly represented, and the same electronic text can be re-used for
many purposes — to provide both online hypertext or browsable versions and well-formatted
typeset versions from a common source for example.

To facilitate this, the TEI Lite schema includes some elements for marking features of technical
documents in general, and of XML-related documents in particular.

### 16.1 Additional Elements for Technical Documents

The following elements may be used to mark particular features of technical documents:

- `<eg>` (example) contains any kind of illustrative example.
- `<code>` contains literal code from some formal language such as a programming
  language.
- `<ident>` (identifier) contains an identifier or name for an object of some kind in a formal
  language. `<ident>` is used for tokens such as variable names, class names, type
  names, function names etc. in formal programming languages.
- `<gi>` (element name) contains the name (generic identifier) of an element.
- `<att>` (attribute) contains the name of an attribute appearing within running text.
- `<formula>` contains a mathematical or other formula.
- `<val>` (value) contains a single attribute value.

The following example shows how these elements might be used to encode a passage from a
tutorial introducing the Fortran programming language:

```xml
<p>It is traditional to introduce a language with a
program like the following: <eg xml:space="preserve"> CHAR*12 GRTG
GRTG = 'HELLO WORLD'
```

37
This simple example first declares a variable \texttt{GRTG}, in the line \texttt{CHAR*12 GRTG}, which identifies \texttt{GRTG} as consisting of 12 bytes of type \texttt{CHAR}. To this variable, the value \texttt{HELLO WORLD} is then assigned.

A formatting application, given a text like that above, can be instructed to format examples appropriately (e.g., to preserve line breaks, or to use a distinctive font). Similarly, the use of tags such as \texttt{ident} greatly facilitates the construction of a useful index.

The \texttt{formula} element should be used to enclose a mathematical or chemical formula presented within the text as a distinct item. Since formulae generally include a large variety of special typographic features not otherwise present in ordinary text, it will usually be necessary to present the body of the formula in a specialized notation. The notation used should be specified by the \textit{notation} attribute, as in the following example:

\[
\begin{math}E = mc^{2}\end{math}
\]

A particular problem arises when XML encoding is the subject of discussion within a technical document, itself encoded in XML. In such a document, it is clearly essential to distinguish clearly the markup occurring within examples from that marking up the document itself, and end-tags are highly likely to occur. One simple solution is to use the predefined entity reference \&lt; to represent each \textless character which marks the start of an XML tag within the examples. A more general solution is to mark off the whole body of each example as containing data which is not to be scanned for XML mark-up by the parser. This is achieved by enclosing it within a special XML construct called a \textit{CDATA marked section}, as in the following example:

A list should be encoded as follows: \texttt{<list>First item in the list</item>Second item</item> </list>} The \texttt{list} element consists of a series of \texttt{item} elements.

The \texttt{list} element used within the example above will not be regarded as forming part of the document proper, because it is embedded within a marked section (beginning with the special markup declaration \texttt{<![CDATA[}, and ending with \texttt{]]>}).

Note also the use of the \texttt{gi} element to tag references to element names (or generic identifiers) within the body of the text.

\section*{16.2 Generated Divisions}

Most modern document production systems have the ability to generate automatically whole sections such as a table of contents or an index. The TEI Lite scheme provides an element to mark the location at which such a generated section should be placed. \texttt{<divGen>} (automatically generated text division) indicates the location at which a textual division generated automatically by a text-processing application is to appear.
16.3 Index Generation

The `<divGen>` element can be placed anywhere that a division element would be legal, as in the following example:

```
<front>
  <titlePage>
  </titlePage>
  <divGen type="toc"/>
  <div>
    <head>Preface</head>
  </div>
</front>

<body>
  <!-- ... -->
</body>

<back>
  <divGen type="index" n="Index"/>
</back>
```

This example also demonstrates the use of the `type` attribute to distinguish the different kinds of division to be generated: in the first case a table of contents (a `toc`) and in the second an index.

When an existing index or table of contents is to be encoded (rather than one being generated) for some reason, the `<list>` element discussed in section 11. Lists should be used.

16.3 Index Generation

While production of a table of contents from a properly tagged document is generally unproblematic for an automatic processor, the production of a good quality index will often require more careful tagging. It may not be enough simply to produce a list of all parts tagged in some particular way, although extracting (for example) all occurrences of elements such as `<term>` or `<name>` will often be a good departure point for an index.

The TEI schema provides a special purpose `<index>` tag which may be used to mark both the parts of the document which should be indexed, and how the indexing should be done. `<index>` (index entry) marks a location to be indexed for whatever purpose.

For example, the second paragraph of this section might include the following:

```
... TEI lite also provides a special purpose
<gi>index</gi> tag
  <index>
    <term>indexing</term>
  </index>
  <index>
    <term>index (tag)</term>
    <index>
      <term>use in index generation</term>
    </index>
  </index>
which may be used ...
```

The `<index>` element can also be used to provide a form of interpretive or analytic information. For example, in a study of Ovid, it might be desired to record all the poet’s
references to different figures, for comparative stylistic study. In the following lines of the
Metamorphoses, such a study would record the poet’s references to Jupiter (as deus, se, and as
the subject of confiteor [in inflectional form number 227]), to Jupiter-in-the-guise-of-a-bull (as
imago tauri fallacis and the subject of teneo), and so on.

\[
\text{iamque deus posita fallacis}
\text{imagine tauri}
\]
\[
\text{se confessus erat Dictaeaque rura tenebat}
\]

This need might be met using the <note> element discussed in section 7. Notes, or with the
<interp> element discussed in section 15. Interpretation and Analysis. Here we demonstrate
how it might also be satisfied by using the <index> element.

We assume that the object is to generate more than one index: one for names of deities (called
dn), another for onomastic references (called on), a third for pronominal references (called pr)
and so forth. One way of achieving this might be as follows:

\[
\text{iamque deus posita}
\text{imagine tauri } \text{<index indexName="dn">}
\text{<term>Iuppiter</term>}
\text{<index>}
\text{<term>deus</term>}
\text{</index>}
\text{<index indexName="on">}
\text{<term>Iuppiter (taurus)</term>}
\text{<index>}
\text{<term>imago tauri}
\text{fallacis</term>}
\text{</index>}
\text{</index>}
\]
\[
\text{se confessus erat Dictaeaque rura tenebat}
\text{<index indexName="pr">}
\text{<term>Iuppiter</term>}
\text{<index>}
\text{<term>se</term>}
\text{</index>}
\text{<index indexName="v">}
\text{<term>Iuppiter</term>}
\text{<index>}
\text{<term>confiteor (v227)</term>}
\text{</index>}
\text{</index>}
\]

For each <index> element above, an entry will be generated in the appropriate index, using
as headword the content of the <term> element it contains; the <term> elements nested
within the secondary <index> element in each case provide a secondary keyword. The actual
reference will be taken from the context in which the <index> element appears, i.e. in this case
the identifier of the <l> element containing it.

The analysis is taken, with permission, from Willard McCarty and Burton Wright, An Analytical Onomasticon
to the Metamorphoses of Ovid (Princeton: Princeton University Press, forthcoming). Some simplifications have
been undertaken.
16.4 Addresses

The `<address>` element is used to mark a postal address of any kind. It contains one or more `<addrLine>` elements, one for each line of the address.

`<address>` contains a postal address, for example of a publisher, an organization, or an individual.

`<addrLine>` (address line) contains one line of a postal address.

Here is a simple example:

```xml
<address>
  <addrLine>Computer Center (M/C 135)</addrLine>
  <addrLine>1940 W. Taylor, Room 124</addrLine>
  <addrLine>Chicago, IL 60612-7352</addrLine>
  <addrLine>U.S.A.</addrLine>
</address>
```

The individual parts of an address may be further distinguished by using the `<name>` element discussed above (section 10.1. Names and Referring Strings).

```xml
<address>
  <addrLine>Computer Center (M/C 135)</addrLine>
  <addrLine>1940 W. Taylor, Room 124</addrLine>
  <name type="city">Chicago</name>, IL 60612-7352
  <name type="country">USA</name>
</address>
```

17 Character Sets, Diacritics, etc.

With the advent of XML and its adoption of Unicode as the required character set for all documents, most problems previously associated with the representation of the diverse languages and writing systems of the world are greatly reduced. For those working with standard forms of the European languages in particular, almost no special action is needed: any XML editor should enable you to input accented letters or other non-ASCII characters directly, and they should be stored in the resulting file in a way which is transferable directly between different systems.

There are two important exceptions: the characters `&` and `<` may not be entered directly in an XML document, since they have a special significance as initiating markup. They must always be represented as entity references, like this: `&amp;` or `&lt;`. Other characters may also be represented by means of entity reference where necessary, for example to retain compatibility with a pre-Unicode processing system.

18 Front and Back Matter

18.1 Front Matter

For many purposes, particularly in older texts, the preliminary material such as title pages, prefatory epistles, etc., may provide very useful additional linguistic or social information. P5 provides a set of recommendations for distinguishing the textual elements most commonly encountered in front matter, which are summarized here.

18.1.1 Title Page

The start of a title page should be marked with the element `<titlePage>`. All text contained on the page should be transcribed and tagged with the appropriate element from the following list:
<titlePage> (title page) contains the title page of a text, appearing within the front or back matter.

<docTitle> (document title) contains the title of a document, including all its constituents, as given on a title page.

<titlePart> contains a subsection or division of the title of a work, as indicated on a title page.

<byline> contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.

<docAuthor> (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline).

<docDate> (document date) contains the date of a document, as given on a title page or in a dateline.

<docImprint> (document imprint) contains the imprint statement (place and date of publication, publisher name), as given (usually) at the foot of a title page.

<epigraph> contains a quotation, anonymous or attributed, appearing at the start or end of a section or on a title page.

Typeface distinctions should be marked with the rend attribute when necessary, as described above. Very detailed description of the letter spacing and sizing used in ornamental titles is not as yet provided for by the Guidelines. Changes of language should be marked by appropriate use of the xml:lang attribute or the <foreign> element, as necessary. Names of people, places, or organizations, may be tagged using the <name> element wherever they appear if no other more specific element is available.

Two example title pages follow:

```
<titlePage rend="Roman">
<docTitle>
<titlePart type="main"> PARADISE REGAIN'D. A POEM In IV <hi>BOOKS</hi>. </titlePart>
</docTitle>
<titlePart> To which is added <title>SAMSON AGONISTES</title>. </titlePart>
</docTitle>
<byline>The Author <docAuthor>JOHN MILTON</docAuthor>.
</byline>
<docImprint>
<name>LONDON</name>, Printed by <name>J.M.</name> for <name>John Starkey</name> at the <name>Mitre</name> in <name>Fleetstreet</name>, near <name>Temple-Bar</name>.
</docImprint>
<docDate>MDCLXXI</docDate>
</titlePage>
```

```
<titlePage>
<docTitle>
<titlePart type="main"> Lives of the Queens of England, from the Norman Conquest; </titlePart> <titlePart type="sub"> with anecdotes of their courts. </titlePart>
</docTitle>
<titlePart> Now first published from Official Records and other authentic documents private as well as public. </titlePart>
```
18.1 Front Matter

As elsewhere, the ref attribute may be used to link a name with a canonical definition of the entity being named. For example:

```xml
<byline>By <docAuthor>Agnes Strickland</docAuthor>
</byline>
```

18.1.2 Prefatory Matter

Major blocks of text within the front matter should be marked using <div> elements; the following suggested values for the type attribute may be used to distinguish various common types of prefatory matter:

- **preface** A foreword or preface addressed to the reader in which the author or publisher explains the content, purpose, or origin of the text.
- **dedication** A formal offering or dedication of a text to one or more persons or institutions by the author.
- **abstract** A summary of the content of a text as continuous prose.
- **ack** A formal declaration of acknowledgment by the author in which persons and institutions are thanked for their part in the creation of a text.
- **contents** A table of contents, specifying the structure of a work and listing its constituents. The <list> element should be used to mark its structure.
- **frontispiece** A pictorial frontispiece, possibly including some text.

Where other kinds of prefatory matter are encountered, the encoder is at liberty to invent other values for the type attribute.

Like any text division, those in front matter may contain low level structural or non-structural elements as described elsewhere. They will generally begin with a heading or title of some kind which should be tagged using the <head> element. Epistles will contain the following additional elements:

- **<salute>** (salutation) contains a salutation or greeting prefixed to a foreword, dedicatory epistle, or other division of a text, or the salutation in the closing of a letter, preface, etc.
- **<signed>** (signature) contains the closing salutation, etc., appended to a foreword, dedicatory epistle, or other division of a text.
- **<byline>** contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.
18 FRONT AND BACK MATTER

<dateline> contains a brief description of the place, date, time, etc. of production of a letter, newspaper story, or other work, prefixed or suffixed to it as a kind of heading or trailer.

<argument> contains a formal list or prose description of the topics addressed by a subdivision of a text.

<cit> (cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example.

<imprimatur> contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<opener> groups together dateline, byline, salutation, and similar phrases appearing as a preliminary group at the start of a division, especially of a letter.

<closer> groups together salutations, datelines, and similar phrases appearing as a final group at the end of a division, especially of a letter.

Epistles which appear elsewhere in a text will, of course, contain these same elements. As an example, the dedication at the start of Milton’s *Comus* should be marked up as follows:

```xml
<div type="dedication">
  <head>To the Right Honourable <name>JOHN Lord Viscount BRACLY</name>, Son and Heir apparent to the Earl of Bridgewater, &c.</head>
  <salute>MY LORD,</salute>
  <p>THis <hi>Poem</hi>, which receiv'd its first occasion of Birth from your Self, and others of your Noble Family .... and as in this representation your attendant <name>Thyrsis</name>, so now in all reall expression</p>
  <closer>
    <salute>Your faithfull, and most humble servant</salute>
    <signed><name>H. LAWES.</name></signed>
  </closer>
</div>
```

18.2 Back Matter

18.2.1 Structural Divisions of Back Matter

Because of variations in publishing practice, back matter can contain virtually any of the elements listed above for front matter, and the same elements should be used where this is so. Additionally, back matter may contain the following types of matter within the <back> element. Like the structural divisions of the body, these should be marked as <div> elements, and distinguished by the following suggested values of the type attribute:

appendix An ancillary self-contained section of a work, often providing additional but in some sense extra-canonical text.

glossary A list of terms associated with definition texts (‘glosses’): this should be encoded as a «list type=”gloss”» element

notes A section in which textual or other kinds of notes are gathered together.

bibliogr A list of bibliographic citations: this should be encoded as a <listBibl>

index Any form of pre-existing index to the work (An index may also be generated for a document by using the <index> element described above).
colophon A statement appearing at the end of a book describing the conditions of its physical production.

19 The Electronic Title Page

Every TEI text has a header which provides information analogous to that provided by the title page of printed text. The header is introduced by the element <teiHeader> and has four major parts:

- <fileDesc> (file description) contains a full bibliographic description of an electronic file.
- <encodingDesc> (encoding description) documents the relationship between an electronic text and the source or sources from which it was derived.
- <profileDesc> (text-profile description) provides a detailed description of non-bibliographic aspects of a text, specifically the languages and sublanguages used, the situation in which it was produced, the participants and their setting.
- <revisionDesc> (revision description) summarizes the revision history for a file.

A corpus or collection of texts with many shared characteristics may have one header for the corpus and individual headers for each component of the corpus. In this case the type attribute indicates the type of header. <teiHeader type="corpus"> introduces the header for corpus-level information.

Some of the header elements contain running prose which consists of one or more <p>s. Others are grouped:

- Elements whose names end in Stmt (for statement) usually enclose a group of elements recording some structured information.
- Elements whose names end in Decl (for declaration) enclose information about specific encoding practices.
- Elements whose names end in Desc (for description) contain a prose description.

19.1 The File Description

The <fileDesc> element is mandatory. It contains a full bibliographic description of the file with the following elements:

- <titleStmt> (title statement) groups information about the title of a work and those responsible for its content.
- <editionStmt> (edition statement) groups information relating to one edition of a text.
- <extent> describes the approximate size of a text stored on some carrier medium or of some other object, digital or non-digital, specified in any convenient units.
- <publicationStmt> (publication statement) groups information concerning the publication or distribution of an electronic or other text.
- <seriesStmt> (series statement) groups information about the series, if any, to which a publication belongs.
- <notesStmt> (notes statement) collects together any notes providing information about a text additional to that recorded in other parts of the bibliographic description.
- <sourceDesc> (source description) describes the source(s) from which an electronic text was derived or generated, typically a bibliographic description in the case of a digitized text, or a phrase such as "born digital" for a text which has no previous existence.

A minimal header has the following structure:
19.1.1 The Title Statement

The following elements can be used in the `<titleStmt>`:

- `<title>` contains a title for any kind of work.
- `<author>` in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority.
- `<sponsor>` specifies the name of a sponsoring organization or institution.
- `<funder>` (funding body) specifies the name of an individual, institution, or organization responsible for the funding of a project or text.
- `<principal>` (principal researcher) supplies the name of the principal researcher responsible for the creation of an electronic text.
- `<respStmt>` (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work.

The title of a digital resource derived from a non-digital one will obviously be similar. However, it is important to distinguish the title of the computer file from that of the source text, for example:

```
[title of source]: a machine readable transcription [title of source]: electronic edition A machine readable version of: [title of source]
```

The `<respStmt>` element contains the following subcomponents:

- `<resp>` (responsibility) contains a phrase describing the nature of a person’s intellectual responsibility, or an organization’s role in the production or distribution of a work.
- `<name>` (name, proper noun) contains a proper noun or noun phrase.

Example:

```
<titleStmt>
<title>Two stories by Edgar Allen Poe: a machine readable transcription</title>
<author>Poe, Edgar Allen (1809-1849)</author>
<respStmt>
  <resp>compiled by</resp>
  <name>James D. Benson</name>
</respStmt>
</titleStmt>
```
19.1.2 The Edition Statement

The `<editionStmt>` groups information relating to one edition of the digital resource (where `edition` is used as elsewhere in bibliography), and may include the following elements:

- `<edition>` describes the particularities of one edition of a text.
- `<respStmt>` (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work.

Example:

```xml
<editionStmt>
  <edition n="U2">Third draft, substantially revised <date>1987</date>
</edition>
</editionStmt>
```

Determining exactly what constitutes a new edition of an electronic text is left to the encoder.

19.1.3 The Extent Statement

The `<extent>` statement describes the approximate size of the digital resource.

Example:

```xml
<extent>4532 bytes</extent>
```

19.1.4 The Publication Statement

The `<publicationStmt>` is mandatory. It may contain a simple prose description or groups of the elements described below:

- `<publisher>` provides the name of the organization responsible for the publication or distribution of a bibliographic item.
- `<distributor>` supplies the name of a person or other agency responsible for the distribution of a text.
- `<authority>` (release authority) supplies the name of a person or other agency responsible for making a work available, other than a publisher or distributor.

At least one of these three elements must be present, unless the entire publication statement is in prose. The following elements may occur within them:

- `<pubPlace>` (publication place) contains the name of the place where a bibliographic item was published.
- `<address>` contains a postal address, for example of a publisher, an organization, or an individual.
- `<idno>` (identifier) supplies any form of identifier used to identify some object, such as a bibliographic item, a person, a title, an organization, etc. in a standardized way.
- `<availability>` supplies information about the availability of a text, for example any restrictions on its use or distribution, its copyright status, any licence applying to it, etc.
- `<licence>` contains information about a licence or other legal agreement applicable to the text.
- `<date>` contains a date in any format.

Example:
19.1.5 Series and Notes Statements

The `<seriesStmt>` element groups information about the series, if any, to which a publication belongs. It may contain `<title>`, `<idno>`, or `<respStmt>` elements.

The `<notesStmt>`, if used, contains one or more `<note>` elements which contain a note or annotation. Some information found in the notes area in conventional bibliography has been assigned specific elements in the TEI scheme.

19.1.6 The Source Description

The `<sourceDesc>` is a mandatory element which records details of the source or sources from which the computer file is derived. It may contain simple prose or a bibliographic citation, using one or more of the following elements:

- `<bibl>` (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.
- `<listBibl>` (citation list) contains a list of bibliographic citations of any kind.

Examples:

```xml
<sourceDesc>
  <bibl>The first folio of Shakespeare, prepared by Charlton Hinman (The Norton Facsimile, 1968)</bibl>
</sourceDesc>

<sourceDesc>
  <bibl>
    <author>CNN Network News</author>
    <title>News headlines</title>
    <date>12 Jun 1989</date>
  </bibl>
</sourceDesc>
```

19.2 The Encoding Description

The `<encodingDesc>` element specifies the methods and editorial principles which governed the transcription of the text. Its use is highly recommended. It may be prose description or may contain elements from the following list:

- `<projectDesc>` (project description) describes in detail the aim or purpose for which an electronic file was encoded, together with any other relevant information concerning the process by which it was assembled or collected.
- `<samplingDecl>` (sampling declaration) contains a prose description of the rationale and methods used in sampling texts in the creation of a corpus or collection.
19.2 The Encoding Description

<editorialDecl> (editorial practice declaration) provides details of editorial principles and practices applied during the encoding of a text.

<refsDecl> (references declaration) specifies how canonical references are constructed for this text.

<classDecl> (classification declarations) contains one or more taxonomies defining any classificatory codes used elsewhere in the text.

19.2.1 Project and Sampling Descriptions
Examples of <projectDesc> and <samplingDesc>:</p>

```xml
<encodingDesc>
  <projectDesc>
    <p>Texts collected for use in the Claremont Shakespeare Clinic, June 1990.</p>
  </projectDesc>
</encodingDesc>

<encodingDesc>
  <samplingDecl>
    <p>Samples of 2000 words taken from the beginning of the text</p>
  </samplingDecl>
</encodingDesc>
```

19.2.2 Editorial Declarations
The <editorialDecl> contains a prose description of the practices used when encoding the text. Typically this description should cover such topics as the following, each of which may conveniently be given as a separate paragraph.

- **correction**  how and under what circumstances corrections have been made in the text.
- **normalization**  the extent to which the original source has been regularized or normalized.
- **quotation** what has been done with quotation marks in the original – have they been retained or replaced by entity references, are opening and closing quotes distinguished, etc.
- **hyphenation** what has been done with hyphens (especially end-of-line hyphens) in the original – have they been retained, replaced by entity references, etc.
- **segmentation** how has the text has been segmented, for example into sentences, tone-units, graphemic strata, etc.
- **interpretation** what analytic or interpretive information has been added to the text.

Example:

```xml
<editorialDecl>
  <p>The part of speech analysis applied throughout section 4 was added by hand and has not been checked.</p>
  <p>Errors in transcription controlled by using the WordPerfect spelling checker.</p>
  <p>All words converted to Modern American spelling using Webster's 9th Collegiate dictionary.</p>
</editorialDecl>
```
19.2.3 Reference and Classification Declarations

The `<refsDecl>` element is used to document the way in which any standard referencing scheme built into the encoding works. In its simplest form, it consists of prose description.

Example:

```xml
<refsDecl>
  <p>The `<att>n</att>` attribute on each `<gi>div</gi>` contains the canonical reference for each division in the form XX.yyy where XX is the book number in roman numeral and yyy is the section number in arabic.</p>
  <p>Milestone tags refer to the edition of 1830 as E30 and that of 1850 as E50.</p>
</refsDecl>
```

The `<classDecl>` element groups together definitions or sources for any descriptive classification schemes used by other parts of the header. At least one such scheme must be provided, encoded using the following elements:

- `<taxonomy>` defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.
- `<bibl>` (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.
- `<category>` contains an individual descriptive category, possibly nested within a superordinate category, within a user-defined taxonomy.
- `<catDesc>` (category description) describes some category within a taxonomy or text typology, either in the form of a brief prose description or in terms of the situational parameters used by the TEI formal `<textDesc>`.

In the simplest case, the taxonomy may be defined by a bibliographic reference, as in the following example:

```xml
<classDecl>
  <taxonomy xml:id="LC-SH">
    <bibl>Library of Congress Subject Headings</bibl>
  </taxonomy>
</classDecl>
```

Alternatively, or in addition, the encoder may define a special purpose classification scheme, as in the following example:

```xml
<taxonomy xml:id="B">
  <bibl>Brown Corpus</bibl>
  <category xml:id="B.A">
    <catDesc>Press Reportage</catDesc>
  </category>
  <category xml:id="B.A1">
    <catDesc>Daily</catDesc>
  </category>
  <category xml:id="B.A2">
    <catDesc>Sunday</catDesc>
  </category>
  <category xml:id="B.A3">
    <catDesc>National</catDesc>
  </category>
</taxonomy>
```
19.3 The Profile Description

Linkage between a particular text and a category within such a taxonomy is made by means of the `<catRef>` element within the `<textClass>` element, as described in the next section below.

19.3 The Profile Description

The `<profileDesc>` element enables information characterizing various descriptive aspects of a text to be recorded within a single framework. It has three optional components:

- `<creation>` contains information about the creation of a text.
- `<langUsage>` (language usage) describes the languages, sublanguages, registers, dialects, etc. represented within a text.
- `<textClass>` (text classification) groups information which describes the nature or topic of a text in terms of a standard classification scheme, thesaurus, etc.

The `<creation>` element is useful for documenting where a work was created, even though it may not have been published or recorded there.

Example:

```
<creation>
  <date when="1992-08">August 1992</date>
  <name type="place">Taos, New Mexico</name>
</creation>
```

The `<langUsage>` element is useful where a text contains many different languages. It may contain `<language>` elements to document each particular language used:

- `<language>` characterizes a single language or sublanguage used within a text.

For example, a text containing predominantly text in French as spoken in Quebec, but also smaller amounts of British and Canadian English might be documented as follows:

```
<langUsage>
  <language ident="fr-CA" usage="60">Québécois</language>
  <language ident="en-CA" usage="20">Canadian business English</language>
  <language ident="en-GB" usage="20">British English</language>
</langUsage>
```
The `<textClass>` element classifies a text. This may be done with reference to a classification system locally defined by means of the `<classDecl>` element, or by reference to some externally defined established scheme such as the Universal Decimal Classification. Texts may also be classified using lists of keywords, which may themselves be drawn from locally or externally defined control lists. The following elements are used to supply such classifications:

- `<classCode>` (classification code) contains the classification code used for this text in some standard classification system.
- `<catRef>` (category reference) specifies one or more defined categories within some taxonomy or text typology.
- `<keywords>` contains a list of keywords or phrases identifying the topic or nature of a text.

The simplest way of classifying a text is by means of the `<classCode>` element. For example, a text with classification 410 in the Universal Decimal Classification might be documented as follows:

```
<classCode scheme="http://www.udc.org">410</classCode>
```

When a classification scheme has been locally defined using the `<taxonomy>` element discussed in the preceding subsection, the `<catRef>` element should be used to reference it. To continue the earlier example, a work classified in the Brown Corpus as Press reportage - Sunday and also as Religion might be documented as follows:

```
<classCode scheme="http://www.udc.org">410</classCode>
<catRef target="#B.A3 #B.D"/>
```

The element `<keywords>` contains a list of keywords or phrases identifying the topic or nature of a text. As usual, the attribute `scheme` identifies the source from which these terms are taken. For example, if the LC Subject Headings are used, following declaration of that classification system in a `<taxonomy>` element as above:

```
<textClass>
  <keywords scheme="#LCSH">
    <list>
      <item>English literature -- History and criticism -- Data processing.</item>
      <item>English literature -- History and criticism -- Theory etc.</item>
      <item>English language -- Style -- Data processing.</item>
    </list>
  </keywords>
</textClass>
```

Multiple classifications may be supplied using any of the mechanisms described in this section.

19.4 The Revision Description

The `<revisionDesc>` element provides a change log in which each change made to a text may be recorded. The log may be recorded as a sequence of `<change>` elements each of which contains a brief description of the change. The attributes `when` and `who` may be used to identify when the change was carried out and the agency responsible for it.

Example:

```
<revisionDesc>
  <change when="1991-03-06" who="#EMB">File format updated</change>
  <change when="1990-05-25" who="#EMB">Stuart's corrections entered</change>
</revisionDesc>
```
In a production environment it will usually be found preferable to use some kind of automated system to track and record changes. Many such version control systems, as they are known, can also be configured to update the TEI Header of a file automatically.
A List of Elements Described

The TEI Lite schema is a pure subset of TEI P5. In the following list of elements and classes used, some information, notably the examples, derives from the canonical definition for the element in TEI P5 and may therefore refer to elements or attributes not provided by TEI Lite. Note however that only the elements listed here are available within the TEI Lite schema. These specifications also refer to many attributes which although available in TEI Lite are not discussed in this tutorial for lack of space.

A.1 Elements

<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the model.resource class. Multiple <TEI> elements may be combined within a <TEI> (or <teiCorpus>) element. [4. Default Text Structure 15.1. Varieties of Composite Text]

Module textstructure

Attributes

att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
  (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype)

Member of model.describedResource

Contained by

core: teiCorpus
textstructure: TEI

May contain

header: teiHeader
textstructure: TEI text

Note This element is required. It is customary to specify the TEI namespace http://www.tei-c.org/ns/1.0 on it, using the xmlns attribute.

Example

<!-- Example -->

Example
A LIST OF ELEMENTS DESCRIBED

Schematron

Schema Declaration

<abbr>
(abbreviation) contains an abbreviation of any sort.

Module core
**Attributes**

Attributes `att.global` (@xml:id, @n, @xml:lang, @xml:space)
- `att.global.rendition` (@rend)
- `att.global.linking` (@corresp, @next, @prev)
- `att.global.analytic` (@ana)
- `att.global.facs` (@facs)
- `att.global.responsibility` (@cert, @resp)
- `att.global.source` (@source)
- `att.typed` (type, @subtype)

@type allows the encoder to classify the abbreviation according to some convenient typology.

*Derived from* `att.typed`

**Status** Optional

**Datatype** `teidata.enumerated`

Sample values include:

- **suspension** the abbreviation provides the first letter(s) of the word or phrase, omitting the remainder.
- **contraction** the abbreviation omits some letter(s) in the middle.
- **brevigraph** the abbreviation comprises a special symbol or mark.
- **superscription** the abbreviation includes writing above the line.
- **acronym** the abbreviation comprises the initial letters of the words of a phrase.
- **title** the abbreviation is for a title of address (Dr, Ms, Mr, …)
- **organization** the abbreviation is for the name of an organization.
- **geographic** the abbreviation is for a geographic name.

*Note* The `type` attribute is provided for the sake of those who wish to classify abbreviations at their point of occurrence; this may be useful in some circumstances, though usually the same abbreviation will have the same type in all occurrences. As the sample values make clear, abbreviations may be classified by the method used to construct them, the method of writing them, or the referent of the term abbreviated; the typology used is up to the encoder and should be carefully planned to meet the needs of the expected use.

For a typology of Middle English abbreviations, see PETTY.
A LIST OF ELEMENTS DESCRIBED

header: idno
linking: anchor seg

tagdocs: att code gi ident val

character data

Note If abbreviations are expanded silently, this practice should be documented in the
<editorialDecl>, either with a <normalization> element or a <p>.

Example

<choice>
  <expan>North Atlantic Treaty Organization</expan>
  <abbr cert="low">NorATO</abbr>
  <abbr cert="high">NATO</abbr>
  <abbr cert="high" xml:lang="fr">OTAN</abbr>
</choice>

Example

<choice>
  <abbr>SPQR</abbr>
  <expan>senatus populusque romanorum</expan>
</choice>

Content model

<content>

</content>

Schema Declaration

element abbr
{
  att.global.attributes,
  att.typed.attributesubtype,
  attribute type { text }?,
  macro.phraseSeq
}

<add> (addition) contains letters, words, or phrases inserted in the source text by an
author, scribe, or a previous annotator or corrector. [3.4.3. Additions, Deletions, and
Omissions]

Module core
Attributes
  att.global (xml:id, @n, xml:lang, @xml:space)
  (att.global.rendition (@rend)) (att.global.link (corresp, @next, @prev))
  (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility
  (@cert, @resp)) (att.global.source (@source)) att.transcriptional (@status, @cause,
  @seq) (att.editLike (@evidence, @instant)) (att.written (@hand)) att.placement
  (@place) att.typed (@type, @subtype) att.dimensions (@unit, @quantity, @extent,
  @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))

Member of model.pPart.transcriptional

Contained by

analysis: pc sw
In a diplomatic edition attempting to represent an original source, the `<add>` element should not be used for additions to the current TEI electronic edition made by editors or encoders. In these cases, either the `<corr>` or `<supplied>` element are recommended.

In a TEI edition of a historical text with previous editorial emendations in which such additions or reconstructions are considered part of the source text, the use of `<add>` may be appropriate, dependent on the editorial philosophy of the project.

Example

The story I am going to relate is true as to its main facts, and as to the consequences `<add place="above">of these facts</add>` from which this tale takes its title.

Content model

figures: figure formula
header: idno
linking: anchor seg
tagdocs: att code gi ident val

character data

Note Addresses may be encoded either as a sequence of lines, or using any sequence of
component elements from the model.addrPart class. Other non-postal forms of
address, such as telephone numbers or email, should not be included within an
<address> element directly but may be wrapped within an <addrLine> if they form
part of the printed address in some source text.

Example

<Address>
<addrLine>Computing Center, MC 135</addrLine>
<addrLine>P.O. Box 6998</addrLine>
<addrLine>Chicago, IL</addrLine>
<addrLine>60680 USA</addrLine>
</Address>

Example

<addrLine>
<ref target="tel:+1-201-555-0123">(201) 555 0123</ref>
</addrLine>

Content model

<content>
<macroRef key="macro.phraseSeq"/>
</content>

Schema Declaration

element addrLine { att.global.attributes, macro.phraseSeq }
<address> contains a postal address, for example of a publisher, an organization, or an individual. 3.5.2. Addresses 2.2.4. Publication, Distribution, Licensing, etc. 3.11.2.4. Imprint, Size of a Document, and Reprint Information

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility
(@cert, @resp)) (att.global.source (@source))

textstructure: byline closer dateline docAuthor docDate docEdition docImprint
imprimatur opener salute signed titlePart trailer

May contain
analysis: interp interpGrp
core: addrLine gap index lb milestone name note pb rs
figures: figure
header: idno
linking: anchor

Note This element should be used for postal addresses only. Within it, the generic element <addrLine> may be used as an alternative to any of the more specialized elements available from the model.addrPart class, such as <street>, <postcode> etc.

Example Using just the elements defined by the core module, an address could be represented as follows:

```
<address>
  <street>via Marsala 24</street>
  <postcode>40126</postcode>
  <name>Bologna</name>
  <name>Italy</name>
</address>
```

Example When a schema includes the names and dates module more specific elements such as country or settlement would be preferable over generic <name>:

```
<address>
  <street>via Marsala 24</street>
  <postcode>40126</postcode>
  <settlement>Bologna</settlement>
  <country>Italy</country>
</address>
```
A LIST OF ELEMENTS DESCRIBED

Example

```xml
<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL 60608</addrLine>
  <addrLine>USA</addrLine>
</address>
```

Content model

```xml
<content>
  <sequence>
    <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    <sequence minOccurs="1" maxOccurs="unbounded">
      <classRef key="model.addrPart"/>
      <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
  </sequence>
</content>
```

Schema Declaration

```xml
element address
  {
    att.global.attributes,
    ( model.global*, ( model.addrPart, model.global* )+ )
  }
```

<anchor> (anchor point) attaches an identifier to a point within a text, whether or not it corresponds with a textual element. [8.4.2. Synchronization and Overlap, 16.5. Correspondence and Alignment]

Module linking

Attributes

- att.global ( @xml:id, @n, @xml:lang, @xml:space )

figures: figure formula

header: idno

linking: anchor seg

tagdocs: att code gi ident val

character data

Note: Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes key or ref may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource.

In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as Unknown or Anonymous. When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.

Example

<author>British Broadcasting Corporation</author>
<author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de (1634–1693)</author>
<author>Anonymous</author>
<author>Bill and Melinda Gates Foundation</author>
<author><persName>Beaumont, Francis</persName> and <persName>John Fletcher</persName></author>
<author><orgName key="BBC">British Broadcasting Corporation</orgName>: Radio 3 Network</author>

A LIST OF ELEMENTS DESCRIBED

header: idno
linking: anchor seg
tagdocs: att code gi ident val
character data

Note When a single page is being cited, use the from and to attributes with an identical value. When no clear endpoint is provided, the from attribute may be used without to; for example a citation such as p. 3ff might be encoded <!biblScope from="3">p. 3ff<!biblScope>.

It is now considered good practice to supply this element as a sibling (rather than a child) of <!imprint>, since it supplies information which does not constitute part of the imprint.

Example

<!biblScope>pp 12–34<!biblScope>
<!biblScope unit="page" from="12" to="34"/>
<!biblScope unit="volume">II<!biblScope>
<!biblScope unit="page">12<!biblScope>

    ( text | model.limitedPhrase | model.catDescPart )* 
  }
</element>
```

**<catRef>** (category reference) specifies one or more defined categories within some taxonomy or text typology. [2.4.3. The Text Classification](#)

**Module** header

**Attributes**

- `@xml:id`
- `@n`
- `@xml:lang`
- `@xml:space`
- `@rend`
- `@corresp`
- `@next`
- `@prev`
- `@ana`
- `@facs`
- `@cert`
- `@resp`
- `@source`
- `@targetLang`
- `@target`
- `@evaluate`

**@scheme** identifies the classification scheme within which the set of categories concerned is defined, for example by a `<taxonomy>` element, or by some other resource.

**Status** Optional

**Datatype** teidata.pointer

**Contents**

- `textClass`

**May contain** Empty element

**Note** The `scheme` attribute needs to be supplied only if more than one taxonomy has been declared.

**Example**

```xml
<catRef scheme="#myTopics" target="#news prov #sales2"/>
<!-- elsewhere -->
<taxonomy xml:id="#myTopics">
  <category xml:id="news">
    <catDesc>Newspapers</catDesc>
  </category>
  <category xml:id="prov">
    <catDesc>Provincial</catDesc>
  </category>
  <category xml:id="sales2">
    <catDesc>Low to average annual sales</catDesc>
  </category>
</taxonomy>
```

**Content model** `<content> <empty/> </content>`

**Schema Declaration**
A LIST OF ELEMENTS DESCRIBED

```xml
element catRef
{
    att.global.attributes,
    att.pointing.attributes,
    attribute scheme { text }?,
    empty
}
```

`<category>` contains an individual descriptive category, possibly nested within a superordinate category, within a user-defined taxonomy. [2.3.7. The Classification Declaration]

Module header

Note The `who` attribute may be used to point to any other element, but will typically specify a `<respStmt>` or `<person>` element elsewhere in the header, identifying the person responsible for the change and their role in making it.

82
It is recommended that changes be recorded with the most recent first. The status attribute may be used to indicate the status of a document following the change documented.

Example

```xml
<titleStmt>
<editor xml:id="LDB">Lou Burnard</editor>
<respStmt xml:id="BZ">
<resp>copy editing</resp>
{name>Brett Zamir</name>
</respStmt>
</titleStmt>
<!-- ... -->
<revisionDesc status="published">
<change who="#BZ" when="2008-02-02" status="public">Finished chapter 23</change>
<change who="#BZ" when="2008-01-02" status="draft">Finished chapter 2</change>
<change n="P2.2" when="1991-12-21" who="#LDB">Added examples to section 3</change>
<change when="1991-11-11" who="#MSM">Deleted chapter 10</change>
</revisionDesc>
```

Example

```xml
<profileDesc>
<creation>
<ListChange>
<change xml:id="DRAFT1">First draft in pencil</change>
<change xml:id="DRAFT2" notBefore="1880-12-09">First revision, mostly using green ink</change>
<change xml:id="DRAFT3" notBefore="1881-02-13">Final corrections as supplied to printer.</change>
</ListChange>
</creation>
</profileDesc>
```

Content model

```xml

#### Note

Because the children of a <choice> element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel.

Note also that <choice> elements may self-nest.

Where the purpose of an encoding is to record multiple witnesses of a single work, rather than to identify multiple possible encoding decisions at a given point, the <app> element and associated elements discussed in section 12.1. The Apparatus Entry, Readings, and Witnesses should be preferred.

#### Example

An American encoding of *Gulliver’s Travels* which retains the British spelling but also provides a version regularized to American spelling might be encoded as follows.

```xml
<p>Lastly, That, upon his solemn oath to observe all the above articles, the said man-mountain shall have a daily allowance of meat and drink sufficient for the support of <choice><sic>1724</sic><corr>1728</corr></choice>,<choice><orig>favour</orig><reg>favor</reg></choice>.</p>
```

#### Content model

```
<content>
  <alternate minOccurs="2" maxOccurs="unbounded">
    <classRef key="model.choicePart"/>
  </alternate>
</content>
```
(cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example. [3.3.3. Quotation 4.3.1. Grouped Texts 9.3.5.1. Examples]

### Schema Declaration

```
element classCode
{
  att.global.attributes,
  attribute scheme { text },
  macro.phraseSeq.limited
}
```

```
<classDecl> (classification declarations) contains one or more taxonomies defining any
classificatory codes used elsewhere in the text. [2.3.7. The Classification Declaration]
2.3. The Encoding Description
```

#### Module header

**Attributes**

```
att.global ( @xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition ( @rend ))
(att.global.linking  ( @corresp, @next, @prev ))
(att.global.analytic ( @ana ))
(att.global.facs ( @facs ))
(att.global.responsibility ( @cert, @resp ))
(att.global.source ( @source ))
```

**Member of**

```
model.encodingDescPart
```

**Contained by**

```
header: encodingDesc
```

**May contain**

```
header: taxonomy
```

**Example**

```
<classDecl>
  <taxonomy xml:id="LCSH">
    <bibl>Library of Congress Subject Headings</bibl>
  </taxonomy>
</classDecl>
```

**Content model**

```
<content>
  <elementRef key="taxonomy" minOccurs="1"
    maxOccurs="unbounded"/>
</content>
```

```
<classDecl> element classDecl { att.global.attributes, taxonomy+ }
```

87
<closer> groups together salutations, datelines, and similar phrases appearing as a final group at the end of a division, especially of a letter. [4.2.2. Openers and Closers 4.2. Elements Common to All Divisions]

Module textstructure
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.written (@hand)

Member of model.divBottomPart

Example

<closer>
  <salute>I remain, &c. &c.</salute>
  <signed>H. Colburn</signed>
</closer>
</div>

Example

<div type="chapter">
  <p>
    <!-- ... --> and his heart was going like mad and yes I said yes I will
    Yes.
  </p>
</div>

Content model

<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
  </alternate>
</content>
<code>
<elementRef key="signed"/>
<elementRef key="dateline"/>
<elementRef key="salute"/>
<classRef key="model.phrase"/>
<classRef key="model.global"/>
</alternate>
</content>

Schema Declaration

element closer
{
    att.global.attributes,
    att.written.attributes,
    {
        text
        | model.gLike | signed | dateline | salute | model.phrase | model.global
    }
}

<code> contains literal code from some formal language such as a programming language.

[22.1.1. Phrase Level Level Terms]

Module tagdocs

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)

tagdocs: att code gi ident val

character data

Note The <creation> element may be used to record details of a text’s creation, e.g. the date and place it was composed, if these are of interest. It may also contain a more structured account of the various stages or revisions associated with the evolution of a text; this should be encoded using the <listChange> element. It should not be confused with the <publicationStmt> element, which records date and place of publication.

Example

```xml
<creation>
 <date>Before 1987</date>
</creation>
```
A LIST OF ELEMENTS DESCRIBED

Example

```xml
<creation>
  <date when="1988-07-10">10 July 1988</date>
</creation>
```

**character data**

**Note** This element should be used for deletion of shorter sequences of text, typically single words or phrases. The **<delSpan>** element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.

The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a **<supplied>** tag). Illegible or lost text within a deletion may be marked using the **<gap>** tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the **<gap>** element may be used to indicate how much text is omitted, the reason for omitting
A LIST OF ELEMENTS DESCRIBED

it, etc. If text is not fully legible, the <unclear> element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way.

Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the <certainty> element (see 21. Certainty, Precision, and Responsibility).

There is a clear distinction in the TEI between <del> and <surplus> on the one hand and <gap> or <unclear> on the other. <del> indicates a deletion present in the source being transcribed, which states the author’s or a later scribe’s intent to cancel or remove text. <surplus> indicates material present in the source being transcribed which should have been so deleted, but which is not in fact. <gap> or <unclear>, by contrast, signal an editor’s or encoder’s decision to omit something or their inability to read the source text. See sections 11.3.1.7. Text Omitted from or Supplied in the Transcription and 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for the relationship between these and other related elements used in detailed transcription.

Example

```xml
<l>
  <del rend="overtyped">Mein</del> Frisch
  <del rend="overstrike" type="primary">schwebt</del>
  weht der Wind
</l>
```

Example

```xml
<del rend="overstrike">
  <gap reason="illegible" quantity="5" unit="character"/>
</del>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
<element
del
{
  att.global.attributes,
  att.transcriptional.attributes,
  att.typed.attributes,
  att.dimensions.attributes,
  macro.paraContent}
```

<desc> (description) contains a brief description of the object documented by its parent element, typically a documentation element or an entity. [22.4.1. Description of Components]

character data

Note When used in a specification element such as <elementSpec>, TEI convention requires that this be expressed as a finite clause, beginning with an active verb.

Example

<desc>contains a brief description of the purpose and intended use of a documentation element, or a brief characterisation of a parent entity</desc>

Schematron A <desc> with a type of deprecationInfo should only occur when its parent element is being deprecated. Furthermore, it should always occur in an element that is being deprecated when <desc> is a valid child of that element.

<s:rule context="tei:desc[@type eq 'deprecationInfo']">
<s:assert test=".//@validUntil">Information about a deprecation should only be
present in a specification element that is being deprecated: that is, only an element
that has a @validUntil attribute should have a child <desc
type="deprecationInfo"/>. </sch:assert> </sch:rule>

  {
    ( ( model.divLike | model.divGenLike ), model.global* )+, |
    ( model.common, model.global* )+, |
    ( ( model.divLike | model.divGenLike ), model.global* )*
  }
  ( model.divBottom, model.global* )*?
}

<divGen> (automatically generated text division) indicates the location at which a textual division generated automatically by a text-processing application is to appear. 3.8.2. Index Entries

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility)
(@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype)

@type specifies what type of generated text division (e.g. index, table of contents, etc.) is to appear.
Derived from att.typed
Status Optional
Datatype teidata.enumerated
Sample values include: index an index is to be generated and inserted at this point.
  toc a table of contents
  figlist a list of figures
  tablist a list of tables
Note Valid values are application-dependent; those shown are of obvious utility in document production, but are by no means exhaustive.

Member of model.divGenLike model.frontPart
Contained by textstructure: back body div front
May contain core: head
Note This element is intended primarily for use in document production or manipulation, rather than in the transcription of pre-existing materials; it makes it easier to specify the location of indices, tables of contents, etc., to be generated by text preparation or word processing software.
Example One use for this element is to allow document preparation software to generate an index and insert it in the appropriate place in the output. The example below assumes that the indexName attribute on <index> elements in the text has been used to specify index entries for the two generated indexes, named NAMES and THINGS:

```xml
<back>
  <div1 type="backmat">
    <head>Bibliography</head>
    <!-- ... -->
  </div1>
  <div1 type="backmat">
    <head>Indices</head>
    <divGen n="Index Nominum" type="NAMES"/>
    <divGen n="Index Rerum" type="THINGS"/>
  </div1>
</back>
```

Example Another use for <divGen> is to specify the location of an automatically produced table of contents:

```xml
<front>
  <!--titlePage-->...
  <divGen type="toc"/>
  <div>
    <head>Preface</head>
    <p>...</p>
  </div>
</front>
```

Content model

```xml
<content>
  <classRef key="model.headLike"
    minOccurs="0" maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```xml
element divGen
{
  att.global.attributes,
  att.typed.attribute subtype,
  attribute type { text }?,
  model.headLike*
}
```

<docAuthor> (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline). [4.6. Title Pages]

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
  (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility
    (@cert, @resp)) (att.global.source (@source)) att.canonical (@key, @ref)
Member of model.divWrapper model.pLike.front model.titlepagePart
Contained by
The document author’s name often occurs within a byline, but the <docAuthor> element may be used whether the <byline> element is used or not. It should be used only for the author(s) of the entire document, not for author(s) of any subset or part of it. (Attributions of authorship of a subset or part of the document, for example of a chapter in a textbook or an article in a newspaper, may be encoded with <byline> without <docAuthor>.)

Note

Example

<titlePage>
<docTitle>
<titlePart>Travels into Several Remote Nations of the World, in Four Parts.</titlePart>
</docTitle>
<byline>By <docAuthor>Lemuel Gulliver</docAuthor>, First a Surgeon, and then a Captain of several Ships</byline>
</titlePage>

Content model

<content>
<macroRef key="macro.phraseSeq"/>
</content>

Schema Declaration

element docAuthor {
  att.global.attributes, 
  att.canonical.attributes, 
  macro.phraseSeq
}

<docDate> (document date) contains the date of a document, as given on a title page or in a dateline. [4.6. Title Pages]

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
       (att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
       (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility
       (@cert, @resp)) (att.global.source (@source))
A LIST OF ELEMENTS DESCRIBED

@when gives the value of the date in standard form, i.e. YYYY-MM-DD.

Status Optional

Datatype heidata.temporal.w3c

Note For simple dates, the when attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in XML Schema Part 2: Datatypes Second Edition.

Member of model.divWrapper model.pLike.front model.titlepagePart

Contained by

core: lg list

textstructure: back body dateline div docImprint front group titlePage

figures: figure formula

header: idno

linking: anchor seg

tagdocs: att code gi ident val

character data

Note Cf. the general <date> element in the core tag set. This specialized element is provided for convenience in marking and processing the date of the documents, since it is likely to require specialized handling for many applications. It should be used only for the date of the entire document, not for any subset or part of it.

Example

<docImprint>Oxford, Clarendon Press, <docDate>1987</docDate></docImprint>

Content model

<content>
  <macroRef key="macro.phraseSeq"/>
</content>

Schema Declaration

element docDate
{
  att.global.attributes,
  attribute when { text }?,
  macro.phraseSeq
}

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
Note Cf. the `<edition>` element of bibliographic citation. As usual, the shorter name has been given to the more frequent element.

Example

```xml
```

Schema Declaration

```xml
element docEdition { att.global.attributes, macro.paraContent }
```

<docImprint> (document imprint) contains the imprint statement (place and date of publication, publisher name), as given (usually) at the foot of a title page. [4.6. Title Pages]

Module textstructure

Attributes

```xml
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
```

Member of model.pLike.front model.titlepagePart

character data

Note The content of this element should be the expanded abbreviation, usually (but not always) a complete word or phrase. The <ex> element provided by the transcr module may be used to mark up sequences of letters supplied within such an expansion.

If abbreviations are expanded silently, this practice should be documented in the <editorialDecl>, either with a <normalization> element or a <p>.

Example
The address is Southmoor
<choice>
<expan>Road</expan>
<abbr>Rd</abbr>
</choice>

Example
<choice xml:lang="la">
<abbr>Imp</abbr>
</choice>
Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element expan
{
  att.global.attributes,
  att.editLike.attributes,
  macro.phraseSeq
}
```

`<extent>` describes the approximate size of a text stored on some carrier medium or of some other object, digital or non-digital, specified in any convenient units.

Example

```
<extent>3200 sentences</extent>
<extent>between 10 and 20 Mb</extent>
<extent>ten 3.5 inch high density diskettes</extent>
```

Example: The `<measure>` element may be used to supply normalised or machine tractable versions of the size or sizes concerned.
<figDesc>

About four megabytes

245 pages of source material

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element extent { att.global.attributes, macro.phraseSeq }
```

<figDesc> (description of figure) contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it. [14.4. Specific Elements for Graphic Images]

```

<fileDesc> (file description) contains a full bibliographic description of an electronic file. [2.2. The File Description 2.1.1. The TEI Header and Its Components]

Module header
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility)
(att.global.source (@source))

Contained by
header: teiHeader

May contain
header: editionStmt extent notesStmt publicationStmt seriesStmt sourceDesc titleStmt

Note The major source of information for those seeking to create a catalogue entry or bibliographic citation for an electronic file. As such, it provides a title and statements of responsibility together with details of the publication or distribution of the file, of any series to which it belongs, and detailed bibliographic notes for matters not addressed elsewhere in the header. It also contains a full bibliographic description for the source or sources from which the electronic text was derived.

Example

```xml
<fileDesc>
<titleStmt>
  <title>The shortest possible TEI document</title>
</titleStmt>
```

  - att.global.responsibility (@cert, @resp)
  - att.global.source (@source)

Member of model.emphLike

Contained by
May contain

Note  The global xml:lang attribute should be supplied for this element to identify the language of the word or phrase marked. As elsewhere, its value should be a language tag as defined in §6.1 Language Identification.

This element is intended for use only where no other element is available to mark the phrase or words concerned. The global xml:lang attribute should be used in preference to this element where it is intended to mark the language of the whole of some text element.

The <distinct> element may be used to identify phrases belonging to sublanguages or registers not generally regarded as true languages.

Example

This is heathen Greek to you still? Your <foreign xml:lang="la">lapis philosophicus</foreign>?

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

**Note** Because cultural conventions differ as to which elements are grouped as front matter and which as back matter, the content models for the `<front>` and `<back>` elements are identical.

**Example**

```xml
<front>
  <epigraph>
    <quote>Nam Sibyllam quidem Cumis ego ipse oculis meis vidi in ampulla pendere, et cum illi pueri dicerent: <q xml:lang="grc">Σίβυλλα τί θέλεις</q>; respondebat illa: <q xml:lang="grc">ἀποθανεῖν θέλω.</q></quote>
  </epigraph>
  <div type="dedication">
    For Ezra Pound <q xml:lang="it">il miglior fabbro.</q>
  </div>
</front>
```

**Example**

```xml
<front>
  <div type="dedication">
  </div>
</front>
```
To our three selves

Author's Note

All the characters in this book are purely imaginary, and if the author has used names that may suggest a reference to living persons she has done so inadvertently.

Example

BACKGROUND:

Food insecurity can put children at greater risk of obesity because of altered food choices and nonuniform consumption patterns.

OBJECTIVE:

We examined the association between obesity and both child-level food insecurity and personal food insecurity in US children.

DESIGN:

Data from 9,701 participants in the National Health and Nutrition Examination Survey, 2001-2010, aged 2 to 11 years were analyzed. Child-level food insecurity was assessed with the US Department of Agriculture's Food Security Survey Module based on eight child-specific questions. Personal food insecurity was assessed with five additional questions. Obesity was defined, using physical measurements, as body mass index (calculated as kg/m2) greater than or equal to the age- and sex-specific 95th percentile of the Centers for Disease Control and Prevention growth charts. Logistic regressions adjusted for sex, race/ethnic group, poverty level, and survey year were conducted to describe associations between obesity and food insecurity.

RESULTS:

Obesity was significantly associated with personal food insecurity for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to 2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95% CI 0.51 to 1.51). Child-level food insecurity was not associated with obesity among 2- to 5-year-olds or 6- to 11-year-olds.

CONCLUSIONS:

Personal food insecurity is associated with an increased risk of obesity only in children aged 6 to 11 years. Personal food-insecurity measures may give different results than aggregate food-insecurity measures in children.

```
<gap> indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible. [3.4.3. Additions, Deletions, and Omissions]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global:rendition (@rend)) (att.global:linking (@corresp, @next, @prev))
(att.global:analytic (@ana)) (att.global:facs (@facs)) (att.global:responsibility (@cert, @resp))
(att.global:source (@source)) att.timed (@start, @end) att.editLike (@evidence, @instant)
(att.dimensions (@unit, @quantity, @extent, @precision, @scope)) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))

@reason gives the reason for omission

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: cancelled

deleted
editorial for features omitted from transcription due to editorial policy

illegible

inaudible

irrelevant

sampling

@agent in the case of text omitted because of damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype teidata.enumerated

Sample values include: rubbing damage results from rubbing of the leaf edges

mildew damage results from mildew on the leaf surface

smoke damage results from smoke

A LIST OF ELEMENTS DESCRIBED

core: desc

Note The <gap>, <unclear>, and <del> core tag elements may be closely allied in use with the <damage> and <supplied> elements, available when using the additional tagset for transcription of primary sources. See section 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The <gap> tag simply signals the editors decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that text was deliberately erased or covered, should be indicated using the relevant tags, such as <del> in the case of deliberate deletion.

Example

```
<gap quantity="4" unit="chars"
     reason="illegible"/>
```

Example

```
<gap quantity="1" unit="essay"
     reason="sampling"/>
```

Example

```
<del>
<gap atleast="4" atMost="8" unit="chars"
     reason="illegible"/>
</del>
```

Example

```
<gap extent="several lines" reason="lost"/>
```

Content model

character data

Note The <head> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <head> element based on its structural position. A <head> occurring as the first element of a list is the title of that list; one occurring as the first element of a <div1> is the title of that chapter or section.

Example The most common use for the <head> element is to mark the headings of sections. In older writings, the headings or incipits may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <trailer>, as in this example:

<div1 n="I" type="book">
  <head>In the name of Christ here begins the first book of the ecclesiastical history of
  Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
</div1>

<div2 type="section">
  <head>In the name of Christ here begins Book I of the history.</head>
  <p>Proposing as I do ...</p>
  <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p>
  <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer>
Example. When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the place attribute.

Example. The head element is also used to mark headings of other units, such as lists:

With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. <list rend="bulleted">
<head>Connectives</head>
</list>

A LIST OF ELEMENTS DESCRIBED

(@cert, @resp)) (att.global.source (@source)) att.sortable (@sortKey) att.datable (@period) (att.datable.w3c (@when)) att.typed (----, @subtype)

@type categorizes the identifier, for example as an ISBN, Social Security number, etc.

Derived from att.typed
Status Optional
Datatype teidata.enumerated

Suggested values include:

**ISBN** International Standard Book Number: a 13- or (if assigned prior to 2007) 10-digit identifying number assigned by the publishing industry to a published book or similar item, registered with the International ISBN Agency.

**ISSN** International Standard Serial Number: an eight-digit number to uniquely identify a serial publication.

**DOI** Digital Object Identifier: a unique string of letters and numbers assigned to an electronic document.

**URI** Uniform Resource Identifier: a string of characters to uniquely identify a resource which usually contains indication of the means of accessing that resource, the name of its host, and its filepath.

**VIAF** A data number in the Virtual Internet Authority File assigned to link different names in catalogs around the world for the same entity.

**ESTC** English Short-Title Catalogue number: an identifying number assigned to a document in English printed in the British Isles or North America before 1801.

**OCLC** OCLC control number (record number) for the union catalog record in WorldCat, a union catalog for member libraries in the Online Computer Library Center global cooperative.

character data

Note <idno> should be used for labels which identify an object or concept in a formal cataloguing system such as a database or an RDF store, or in a distributed system.
such as the World Wide Web. Some suggested values for type on <idno> are ISBN, ISSN, DOI, and URI.

Example

```
<idno type="ISBN">978-1-906964-22-1</idno>
<idno type="ISSN">0143-3385</idno>
<idno type="DOI">10.1000/123</idno>
<idno type="URI">http://www.worldcat.org/oclc/185922478</idno>
<idno type="URI">http://authority.nzetc.org/463/</idno>
<idno type="LT">Thomason Tract E.537(17)</idno>
<idno type="Wing">C695</idno>
<idno type="oldCat">
  <g ref="#sym">345</g>
</idno>
```

In the last case, the identifier includes a non-Unicode character which is defined elsewhere by means of a <glyph> or <char> element referenced here as #sym.

Content model

Note Generally, each <interp> element carries an xml:id attribute. This permits the encoder to explicitly associate the interpretation represented by the content of an <interp> with any textual element through its ana attribute. Alternatively (or, in addition) an <interp> may carry an inst attribute which points to one or more textual elements to which the analysis represented by the content of the <interp> applies.

Example

```xml
<interp type="structuralunit" xml:id="ana_am">aftermath</interp>
```

Content model

```xml
<content>
<alternate minOccurs="0" maxOccurs="unbounded">
<textNode/>
<classRef key="model.gLike"/>
<classRef key="model.descLike"/>
<classRef key="model.certLike"/>
</alternate>
</content>
```

Schema Declaration

```xml
element interp
{
  att.global.attributes,
  att.interpLike.attributes,
  ( text | model.gLike | model.descLike | model.certLike )* 
}
```

<interpGrp> (interpretation group) collects together a set of related interpretations which share responsibility or type. [17.3. Spans and Interpretations]

character data

Note May contain simple prose or a sequence of chunks.
Whatever string of characters is used to label a list item in the copy text may be
used as the value of the global n attribute, but it is not required that numbering be
recorded explicitly. In ordered lists, the n attribute on the <item> element is by
definition synonymous with the use of the <label> element to record the enumerator
of the list item. In glossary lists, however, the term being defined should be given
with the <label> element, not n.

Example

<html>
  <head>Here begin the chapter headings of Book IV</head>
  <item n="4.1">The death of Queen Clotild.</item>
  <item n="4.2">How King Lothar wanted to appropriate one third of the
  Church revenues.</item>
  <item n="4.3">The wives and children of Lothar.</item>
  <item n="4.4">The Counts of the Bretons.</item>
  <item n="4.5">Saint Gall the Bishop.</item>
  <item n="4.6">The priest Cato.</item>
  ...</html>

Content model

<content>
  <macroRef key="macro.specialPara"/>
</content>

Schema Declaration

element item
{
  att.global.attributes,
  att sortable.attributes,
  macro.specialPara}
<keywords> contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. The Text Classification]

Module header

Attributes Attributes

att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))

@scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a <taxonomy> element, or by some other resource.

Status Optional

Datatype teidata.pointer

Contained by: textClass

May contain

core: list term

Note Each individual keyword (including compound subject headings) should be supplied as a <term> element directly within the <keywords> element. An alternative usage, in which each <term> appears within a <item> inside a <list> is permitted for backwards compatibility, but is deprecated.

If no control list exists for the keywords used, then no value should be supplied for the scheme attribute.

Example

```xml
<keywords scheme="http://classificationweb.net">
  <term>Babbage, Charles</term>
  <term>Mathematicians - Great Britain - Biography</term>
</keywords>
```

Example

```xml
<keywords>
  <term>Fermented beverages</term>
  <term>Central Andes</term>
  <term>Schinus molle</term>
  <term>Molle beer</term>
  <term>Indigenous peoples</term>
  <term>Ethnography</term>
  <term>Archaeology</term>
</keywords>
```

Content model

```xml
<content>
  <alternate>
    <elementRef key="term" minOccurs="1" maxOccurs="unbounded"/>
  </alternate>
</content>
```

character data

Example: Labels are commonly used for the headwords in glossary lists; note the use of the
global xml:lang attribute to set the default language of the glossary list to Middle
English, and identify the glosses and headings as modern English or Latin:

<list type="gloss" xml:lang="enm">
  <head xml:lang="en">Vocabulary</head>
  <headLabel xml:lang="en">Middle English</headLabel>
  <headItem xml:lang="en">New English</headItem>
  <label>nu</label>
  <item xml:lang="en">now</item>
  <label>lhude</label>
</list>
A LIST OF ELEMENTS DESCRIBED

Example Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's Autobiography. In this usage the <label> element is synonymous with the n attribute on the <item> element:

I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos.

Example Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

<list>
  <label>March 1757.</label>
  <item>I wrote some critical observations upon Plautus.</item>
  <label>March 8th.</label>
  <item>I wrote a long dissertation upon some lines of Virgil.</item>
  <label>June.</label>
  <item>I saw Mademoiselle Curchod — <quote xml:lang="la">Omnia vincit amor, et nos cedamus amori.</quote></item>
  <label>August.</label>
  <item>I went to Crassy, and staid two days.</item>
</list>
Note that the `<label>` might also appear within the `<item>` rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.

*Example* Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the `<label>` element appears *within* the `<p>` or `<lg>` element, rather than as a preceding sibling of it.

```xml
<p> [...] </p>
<label> n’entrer en mauvais & mal-heur.</label>
<label> ré mefnage. Or des que le confente-</label>
<label> ment des parties y eft le mariage eft</label>
<label> arrefté, quoy que de faict il ne foit</label>
<label> Puiffance maritale</label>
entre les Romains.</label>
<label> confoome. Depuis la confooma-</label>
<label> tion du mariage la femme eft foubs</label>
<label> puiffance du mary, s’il n’eſt efcla-</label>
<label> ve ou enfant de famille : car en ce</label>
<label> cas, la femme, qui a eſpouſé vn en-</label>
<label> fant de famille, eſt foubs la puiffance</label>
[...]</p>
```

In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the *type* attribute may be used to distinguish different categories of label.

May contain Empty element

Note By convention, <lb> elements should appear at the point in the text where a new line starts. The n attribute, if used, indicates the number or other value associated with the text between this point and the next <lb> element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the <l> element is available) except in circumstances where structural units cannot otherwise be marked.

The type attribute may be used to characterize the line break in any respect. The more specialized attributes break, ed, or edRef should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

Example This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```xml
<l>Of Mans First Disobedience,<lb ed="1674"/> and <lb ed="1667"/> the Fruit</l>
<l>Of that Forbidden Tree, whose <lb ed="1667 1674"/> mortal tast</l>
<l>Brought Death into the World,<lb ed="1667"/> and all <lb ed="1674"/> our woe,</l>
```

Example This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The break attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.

```xml
<titlePart>
  <lb/>With Additions, ne<lb break="no"/>ver before Printed.
</titlePart>
```

Content model <content> <empty/></content>

Schema Declaration

```
element lb
{
  att.global.attributes,
  att.typed.attributes,
  att.edition.attributes,
  att.spanning.attributes,
  att.breaking.attributes,
  empty
}
```

<lg> (line group) contains one or more verse lines functioning as a formal unit, e.g. a stanza, refrain, verse paragraph, etc. 3.12.1. Core Tags for Verse 3.12. Passages of Verse or Drama 7.2.5. Speech Contents

<list> contains any sequence of items organized as a list. [3.7. Lists]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.faces (@faces)) (att.global.responsibility
  (@cert, @resp)) (att.global.source (@source)) att.sortable (@sortKey) att.typed
  (——, @subtype)

@type describes the nature of the items in the list.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: gloss each list item glosses some term or concept, which is given by a <label> element preceding the list item.
A LIST OF ELEMENTS DESCRIBED

index each list item is an entry in an index such as the alphabetical topical index at the back of a print volume.

instructions each list item is a step in a sequence of instructions, as in a recipe.

litany each list item is one of a sequence of petitions, supplications or invocations, typically in a religious ritual.

syllogism each list item is part of an argument consisting of two or more propositions and a final conclusion derived from them.

Note Previous versions of these Guidelines recommended the use of type on <list> to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the rend or style attributes for these aspects of a list, while using type for the more appropriate task of characterizing the nature of the content of a list.

The formal syntax of the element declarations allows |<label>| tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.

Note May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.

Example

```xml
<list rend="numbered">
  <item>a butcher</item>
  <item>a baker</item>
  <item>a candlestick maker, with</item>
  <list rend="bulleted">
    <item>rings on his fingers</item>
    <item>bells on his toes</item>
  </list>
</list>
```

Example

```xml
<list type="syllogism" rend="bulleted">
  <item>All Cretans are liars.</item>
```

156
Epimenides is a Cretan.

ERGO Epimenides is a liar.

Example

God save us from drought.

God save us from pestilence.

God save us from wickedness in high places.

Praise be to God.

Example The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):

Concerning thieves. First, that no thief is to be spared who is caught with the stolen goods, [if he is] over twelve years and [if the value of the goods is] over eightpence.

And if anyone does spare one, he is to pay for the thief with his wergild — and the thief is to be no nearer a settlement on that account — or to clear himself by an oath of that amount.

If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve].

If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever.

And if he steals after that, they are to pay for him with his wergild, or to bring him back there.

And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a fine.

Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting.

And if they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him down as a thief.

And he who harbours him after that, is to pay for him
with his wergild 
or to clear himself by an oath of that amount.</item>
</list>
</item>
</list>

Concerning the refusal of justice. The lord who refuses justice and upholds 
his guilty man, so that the king is appealed to, is to repay the value of the goods and 
120 shillings to the king; and he who appeals to the king before he demands justice as 
often as he ought, is to pay the same fine as the other would have done, if he had 
refused him justice.

And the lord who is an accessory to a theft by his slave, and it becomes 
known about him, is to forfeit the slave and be liable to his wergild on the first 
occasion if he does it more often, he is to be liable to pay all that he owns.

And likewise any of the king’s treasurers or of our reeves, who has been 
an accessory of thieves who have committed theft, is to liable to the same.

Concerning treachery to a lord. And we have pronounced concerning treachery to 
a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is 
afterwards convicted at the three-fold ordeal.

Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.

Example

<p>These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross.</p>

I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.

I, Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.

I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.

I, Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.
<item>I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.</item>

<item>I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.</item>

<item>I, Æthelwine, bishop, have subscribed through delegates.</item>

<item>I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.</item>

att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.placement (@place) att.pointing (@targetLang, @target, @evaluate) att.typed (@type, @subtype) att.written (@hand)

@anchored indicates whether the copy text shows the exact place of reference for the note.

Status Optional
Datatype teidata.truthValue
Default true

Note In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. page 218, lines 3–4). The anchored attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an explicit location is indicated in the copy text; the value false indicates that the copy text does not indicate a specific place of attachment for the note. If the specific symbols used in the copy text at the location the note is anchored are to be recorded, use the n attribute.

@targetEnd points to the end of the span to which the note is attached, if the note is not embedded in the text at that point.

Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note This attribute is retained for backwards compatibility; it may be removed at a subsequent release of the Guidelines. The recommended way of pointing to a span of elements is by means of the range function of XPointer, as further described in 16.2.4.6.

character data

Example In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":

And yet it is not only in the great line of Italian renaissance art, but even in the painterly <note place="bottom" type="gloss" resp="#MDMH">
<term xml:lang="de">Malerisch</term>. This word has, in the German, two distinct meanings, one objective, a quality residing in the object, the other subjective, a mode of apprehension and creation. To avoid confusion, they have been distinguished in English as <mentioned>picturesque</mentioned> and <mentioned>painterly</mentioned> respectively. </note> style of the Dutch genre painters of the seventeenth century that drapery has this psychological significance.

</!-- elsewhere in the document -->
<respStmt xml:id="MDMH">
<resp>translation from German to English</resp>
<name>Hottinger, Marie Donald Mackie</name>
</respStmt>

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example The global n attribute may be used to supply the symbol or number used to mark the note’s point of attachment in the source text, as in the following example:

Mevorakh b. Saadya’s mother, the matriarch of the family during the second half of the eleventh century, <note n="126" anchored="true"> The alleged mention of Judah Nagid’s mother in a letter from 1071 is, in fact, a reference to Judah’s children; cf. above, nn. 111 and 54. </note> is well known from Geniza documents published by Jacob Mann.

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

Content model
<notesStmt>

<content>

</content>

Schema Declaration

element notesStmt { att.global.attributes, ( model.noteLike | relatedItem )+ }
A LIST OF ELEMENTS DESCRIBED

<num> (number) contains a number, written in any form. [3.5.3. Numbers and Measures]

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility
(@cert, @resp)) (att.global.source (@source)) att.ranging (@atLeast, @atMost, @min,
@max, @confidence) att.typed (:.--., @subtype)

@type indicates the type of numeric value. Derived from att.typed
Status Optional
Datatype teidata.enumerated
Suggested values include: cardinal absolute number, e.g. 21, 21.5

ordinal ordinal number, e.g. 21st

fraction fraction, e.g. one half or three-quarters

percentage a percentage

Note If a different typology is desired, other values can be used for this
attribute.

@value supplies the value of the number in standard form.
Status Optional
Datatype teidata.numeric
Values a numeric value.

Note The standard form used is defined by the TEI datatype
data.numeric.

character data
Note Detailed analyses of quantities and units of measure in historical documents may also use the feature structure mechanism described in chapter 18. Feature Structures. The `<num>` element is intended for use in simple applications.

Example

```xml
<p>I reached <num type="cardinal" value="21">twenty-one</num> on my <num type="ordinal" value="21">twenty-first</num> birthday.</p>
<p>Light travels at <num value="3E10">3×10<hi rend="sup">10</hi></num> cm per second.</p>
```

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
<element num
{  
  att.global.attributes,
  att.typed.attribute.subtype,
  att.ranging.attributes,
  attribute type { "cardinal" | "ordinal" | "fraction" | "percentage" }?,
  attribute value { text }?,
  macro.phraseSeq}
```

`<opener>` groups together dateline, byline, salutation, and similar phrases appearing as a preliminary group at the start of a division, especially of a letter. [4.2. Elements Common to All Divisions]

          salute signed text titlePage titlePart trailer

May contain Empty element

Note A `<pb>` element should appear at the start of the page which it identifies. The
global n attribute indicates the number or other value associated with this page.
This will normally be the page number or signature printed on it, since the physical
sequence number is implicit in the presence of the `<pb>` element itself.
The type attribute may be used to characterize the page break in any respect. The
more specialized attributes break, ed, or edRef should be preferred when the intent is
to indicate whether or not the page break is word-breaking, or to note the source
from which it derives.

Example Page numbers may vary in different editions of a text.
A LIST OF ELEMENTS DESCRIBED

Example  A page break may be associated with a facsimile image of the page it introduces by means of the `facs` attribute

```xml
<body>
  <pb n="1" facs="page1.png"/>
  <!-- page1.png contains an image of the page; the text it contains is encoded here -->
  <p>
    <!-- ... -->
  </p>
  <pb n="2" facs="page2.png"/>
  <!-- similarly, for page 2 -->
  <p>
    <!-- ... -->
  </p>
</body>
```

Content model  `<content> <empty/></content>`

Schema Declaration

```xml
<element pb
{
  att.global.attributes,
  att.typed.attributes,
  att.edition.attributes,
  att.spanning.attributes,
  att.breaking.attributes,
  empty
}
```

<pc> (punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark. [17.1.2. Below the Word Level 17.4.2. Lightweight Linguistic Annotation]

Module analysis

Attributes  `att.global` (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))

   att.global.attributes,
A LIST OF ELEMENTS DESCRIBED

| att.naming.attributes, macro.phraseSeq |

<publicationStmt> (publication statement) groups information concerning the publication or distribution of an electronic or other text. [2.2.4. Publication, Distribution, Licensing, etc. 2.2. The File Description]

Module header
Attributes: *att.global* (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))

Contained by header: fileDesc
May contain
core: address date ptr pubPlace publisher ref
header: authority availability distributor idno

Note Where a publication statement contains several members of the model.publicationStmtPart.agency or model.publicationStmtPart.detail classes rather than one or more paragraphs or anonymous blocks, care should be taken to ensure that the repeated elements are presented in a meaningful order. It is a conformance requirement that elements supplying information about publication place, address, identifier, availability, and date be given following the name of the publisher, distributor, or authority concerned, and preferably in that order.

Example

```xml
<publicationStmt>
  <publisher>C. Muquardt</publisher>
  <pubPlace>Bruxelles & Leipzig</pubPlace>
  <date when="1846"/>
</publicationStmt>
```

Example

```xml
<publicationStmt>
  <publisher>Chadwyck Healey</publisher>
  <pubPlace>Cambridge</pubPlace>
  <availability>
    <p>Available under licence only</p>
  </availability>
  <date when="1992">1992</date>
</publicationStmt>
```

Example

```xml
<publicationStmt>
  <publisher>Zea Books</publisher>
  <pubPlace>Lincoln, NE</pubPlace>
  <date>2017</date>
  <availability>
    <p>This is an open access work licensed under a Creative Commons Attribution 4.0 International license.</p>
  </availability>
```

Schema Declaration

element publisher
{
  att.global.attributes,
  att.canonical.attributes,
  macro.phraseSeq
}

<q> (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

3.3.3. Quotation

Module core

Attributes

att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
  (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp))
  (att.global.source (@source)) att.ascribed.directed (@toWhom)

@type may be used to indicate whether the offset passage is spoken or thought, or to characterize it more finely.

Status Optional

Datatype teidata.enumerated

Suggested values include: spoken representation of speech
  thought representation of thought, e.g. internal monologue
  written quotation from a written source
  soCalled authorial distance
  foreign
  distinct linguistically distinct
  term technical term
  emph rhetorically emphasized
  mentioned refering to itself, not its normal referent
Member of \texttt{model.qLike}

\textit{Contained by analysis:}

Member of model.choicePart model.segLike

Contained by
analysis: \texttt{sw}
The `<seg>` element may be used at the encoder’s discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a `<ptr>` or other similar element.

**Example**

```
<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>
```

**Example**

```
<s>
  <seg rend="caps" type="initial-cap">So father’s only</seg> glory was the ballfield.
</s>
```

**Example**

```
<seg type="preamble">
  <seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg>
  <seg>Sinfiotli was the eldest of his sons ...</seg>
  <seg>Borghild, Sigmund’s wife, had a brother ...</seg>
</seg>
```

**Content model**

```
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

**Schema Declaration**
A LIST OF ELEMENTS DESCRIBED

```
<seriesStmt>
(series statement) groups information about the series, if any, to which a publication belongs. [2.2.5. The Series Statement 2.2. The File Description]
```
Schema Declaration

```xml
<element seriesStmt
    {
        att.global.attributes,
        ( model.pLike+ | ( title+, ( editor | respStmt )* , ( idno | biblScope )* ) )
    }
```

<sic> (Latin for thus or so) contains text reproduced although apparently incorrect or inaccurate. [3.4.1. Apparent Errors]

}

<stage> (stage direction) contains any kind of stage direction within a dramatic text or fragment. [3.12.2. Core Tags for Drama 3.12. Passages of Verse or Drama 7.2.4. Stage Directions]

Module core

Attributes Attributes [att.ascribed.directed ( @toWhom)
  (att.ascribed ( @who))]
  (att.global ( @xml:id, @n, @xml:lang, @xml:space))
  (att.global.rendition ( @rend))
  (att.global.linking ( @corresp, @next, @prev))
  (att.global.analytic ( @ana))
@type indicates the kind of stage direction.

Status Recommended

Datatype 0–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: setting describes a setting.

entrance describes an entrance.

exit describes an exit.

business describes stage business.

novelistic is a narrative, motivating stage direction.

delivery describes how a character speaks.

modifier gives some detail about a character.

location describes a location.

mixed more than one of the above

Note If the value mixed is used, it must be the only value. Multiple values may however be supplied if a single stage direction performs multiple functions, for example is both an entrance and a modifier.

@version specifies the version number of the TEI Guidelines against which this document is valid.

Status Optional

Datatype teidata.version

Note: Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the
P5 Guidelines, in the absence of a more precise association provided by the *source* attribute on the associated `<schemaSpec>`.

**Member of** `model.describedResource`

**Contained by**

- `core: teiCorpus`

**May contain**

- `core: teiCorpus`
- `header: teiHeader`
- `textstructure: TEI text`

**Note** Should contain one TEI header for the corpus, and a series of `<TEI>` elements, one for each text.

**Example**

```xml
<teiCorpus version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader> <!-- header for corpus -->
  </teiHeader>
  <TEI>
    <teiHeader> <!-- header for first text -->
      <text> <!-- content of first text -->
      </text>
    </teiHeader>
    <TEI>
      <teiHeader> <!-- header for second text -->
        <text> <!-- content of second text -->
        </text>
      </teiHeader>
      <!-- more TEI elements here -->
      </TEI>
  </TEI>
</teiCorpus>
```

**Content model**

```xml
<content>
  <sequence>
    <elementRef key="teiHeader"/>
    <classRef key="model.resource" minOccurs="0" maxOccurs="unbounded"/>
    <classRef key="model.describedResource" minOccurs="1" maxOccurs="unbounded"/>
  </sequence>
</content>
```

**Schema Declaration**

```xml
element teiCorpus {
  att.global.attributes,
  att.typed.attributes,
  attribute version { text }?,
  ( teiHeader, model.resource*, model.describedResource+ )
}
```
<teiHeader> (TEI header) supplies descriptive and declarative metadata associated with a digital resource or set of resources. [2.1.1. The TEI Header and Its Components] 15.1. Varieties of Composite Text

Module header
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility)
(@cert, @resp) (att.global.source (@source))

Contained by
core: teiCorpus
textstructure: TEI

May contain
header: encodingDesc fileDesc profileDesc revisionDesc

Note One of the few elements unconditionally required in any TEI document.
Example

<teiHeader>
  <fileDesc>
    <titleStmt>
      <title>Shakespeare: the first folio (1623) in electronic form</title>
      <author>Shakespeare, William (1564–1616)</author>
    </titleStmt>
    <respStmt>
      <resp>Originally prepared by</resp>
      <name>Trevor Howard-Hill</name>
    </respStmt>
    <respStmt>
      <resp>Revised and edited by</resp>
      <name>Christine Avern-Carr</name>
    </respStmt>
  </fileDesc>
  <sourceDesc>
    <bibl>The first folio of Shakespeare, prepared by Charlton Hinman (The Norton Facsimile, 1968)</bibl>
  </sourceDesc>
  <projectDesc>
    <p>Originally prepared for use in the production of a series of old-spelling concordances in 1968, this text was extensively checked and revised for use during the editing of the new Oxford Shakespeare (Wells and Taylor, 1989).</p>
  </projectDesc>
  <editorialDecl>
</teiHeader>
Turned letters are silently corrected.

Original spelling and typography is retained, except that long s and ligatured forms are not encoded.

A reference is created by assembling the following, in the reverse order as that listed here:

- The value of the preceding `<lb>`.
- A period.
- The value of the ancestor `<div2>`.
- A space.
- The value of the parent `<div1>`.

A reference is created by assembling the following, in the reverse order as that listed here:

- The value of the preceding `<lb>`.
- A period.
- The value of the ancestor `<div2>`.
- A space.
- The value of the parent `<div1>`.

A reference is created by assembling the following, in the reverse order as that listed here:

- The value of the preceding `<lb>`.
- A period.
- The value of the ancestor `<div2>`.
- A space.
- The value of the parent `<div1>`.

Content model

```xml

character data

Note When this element appears within an <index> element, it is understood to supply the form under which an index entry is to be made for that location. Elsewhere, it is understood simply to indicate that its content is to be regarded as a technical or specialised term. It may be associated with a <gloss> element by means of its ref attribute; alternatively a <gloss> element may point to a <term> element by means of its target attribute.

In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The <term> element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the <term> element to be used by practitioners of any persuasion.

As with other members of the att.canonical class, instances of this element occurring in a text may be associated with a canonical definition, either by means of a URI (using the ref attribute), or by means of some system-specific code value (using the key attribute). Because the mutually exclusive target and cRef attributes overlap
with the function of the ref attribute, they are deprecated and may be removed at a subsequent release.

**Example**

A computational device that infers structure from grammatical strings of words is known as a `<term>parser</term>`, and much of the history of NLP over the last 20 years has been occupied with the design of parsers.

**Example**

We may define `<term xml:id="TDPV1" rend="sc">discoursal point of view</term>` as `<gloss target="#TDPV1">the relationship, expressed through discourse structure, between the implied author or some other addressee, and the fiction.</gloss>`

**Example**

We may define `<term ref="#TDPV2" rend="sc">discoursal point of view</term>` as `<gloss xml:id="TDPV2">the relationship, expressed through discourse structure, between the implied author or some other addressee, and the fiction.</gloss>`

**Example**

We discuss Leech’s concept of `<term ref="myGlossary.xml#TDPV2" rend="sc">discoursal point of view</term>` below.

**Content model**

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

**Schema Declaration**

```xml
<element term {
  att.global.attributes, 
  att.declaring.attributes, 
  att.pointing.attributes, 
  att.typed.attributes, 
  att.canonical.attributes, 
  att.sortable.attributes, 
  att.cReferencing.attributes, 
  macro.phraseSeq}>
```

**<text>** contains a single text of any kind, whether unitary or composite, for example a poem or drama, a collection of essays, a novel, a dictionary, or a corpus sample. [4. Default Text Structure 15.1. Varieties of Composite Text]
Attributes

- `att.global` (@xml:id, @n, @xml:lang, @xml:space)
- `att.global.rendition` (@rend)
- `att.global.linking` (@corresp, @next, @prev)
- `att.global.analytic` (@ana)
- `att.global.facs` (@facs)
- `att.global.responsibility` (@cert, @resp)
- `att.global.source` (@source)
- `att.declaring` (@decls)
- `att.typed` (@type, @subtype)
- `att.written` (@hand)

Member of `model.resource`

Contained by
- `core`: `teiCorpus`
- `textstructure`: `TEI group`

May contain
- `analysis`: `interp`, `interpGrp`
- `core`: `gap`, `index`, `lb`, `milestone`, `note`, `pb`
- `figures`: `figure`
- `linking`: `anchor`
- `textstructure`: `back`, `body`, `front`, `group`

Note

This element should not be used to represent a text which is inserted at an arbitrary point within the structure of another, for example as in an embedded or quoted narrative; the `<floatingText>` is provided for this purpose.

Example

```xml
<text>
  <front>
    <docTitle>
      <titlePart>Autumn Haze</titlePart>
    </docTitle>
  </front>
  <body>
    <l>Is it a dragonfly or a maple leaf?</l>
    <l>That settles softly down upon the water?</l>
  </body>
</text>
```

Example

The body of a text may be replaced by a group of nested texts, as in the following schematic:

```xml
<text>
  <front>
    <!-- front matter for the whole group -->
  </front>
  <group>
    <text>
      <!-- first text -->
    </text>
    <text>
      <!-- second text -->
    </text>
  </group>
</text>
```

Content model

```xml
<content>
  <sequence>
    <classRef key="model.global"
      minOccurs="0" maxOccurs="unbounded"/>
    <sequence minOccurs="0"/>
    <elementRef key="front"/>
  </sequence>
</content>
```
A LIST OF ELEMENTS DESCRIBED

```
<sequence minOccurs="0">
  <elementRef key="body"/>
  <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
</sequence>
<alternate>
  <elementRef key="group"/>
</alternate>
<sequence minOccurs="0">
  <elementRef key="back"/>
  <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
</sequence>
</sequence>
</content>
```

**Schema Declaration**

```xml
<element text=
{
  att.global.attributes,
  att.declaring.attributes,
  att.typed.attributes,
  att.written.attributes,
  (model.global*,
   ( front, model.global* )?,
   ( body | group ),
   model.global*,
   ( back, model.global* )?)
}
```

**<textClass>** (text classification) groups information which describes the nature or topic of a text in terms of a standard classification scheme, thesaurus, etc. [2.4.3. The Text Classification]

**Module header**

```

<title> contains a title for any kind of work. [3.11.2.2, Titles, Authors, and Editors 2.2.1, The Title Statement 2.2.5, The Series Statement]

Module core

Attributes

- **att.global**: `@xml:id, @n, @xml:lang, @xml:space`
- `@xml:id` identifies a unique identifier.
- `@n` is for internal notes.
- `@xml:lang` specifies the language.
- `@xml:space` specifies the whitespace treatment.
- `@rend` specifies the rendition of the title.
- `@corresp` specifies the correspondence.
- `@next` specifies the next title.
- `@prev` specifies the previous title.
- `@ana` specifies the analytic part of the title.
- `@facs` specifies the facsimile number.
- `@cert` specifies the certification.
- `@resp` specifies the responsibility.
- `@source` specifies the source.
- `@key` specifies the key.
- `@ref` specifies the reference.
- `@when` specifies the period.
- `@key` specifies the key.
- `@ref` specifies the reference.
- `@when` specifies the date.
- `@subtype` specifies the subtype.
- `@type` classifies the title according to some convenient typology.

224
Derived from att.typed
Status Optional
Datatype teidata.enumerated
Sample values include: main main title
  sub (subordinate) subtitle, title of part
  alt (alternate) alternate title, often in another language, by which
  the work is also known
  short abbreviated form of title
  desc (descriptive) descriptive paraphrase of the work functioning
  as a title
Note This attribute is provided for convenience in analysing titles and
processing them according to their type; where such specialized
processing is not necessary, there is no need for such analysis, and
the entire title, including subtitles and any parallel titles, may be
enclosed within a single <title> element.
@level indicates the bibliographic level for a title, that is, whether it identifies an
article, book, journal, series, or unpublished material.
Status Optional
Datatype teidata.enumerated
Legal values are: a (analytic) the title applies to an analytic item, such
  as an article, poem, or other work published as part of a larger
  item.
  m (monographic) the title applies to a monograph such as a book
  or other item considered to be a distinct publication, including
  single volumes of multi-volume works
  j (journal) the title applies to any serial or periodical publication
  such as a journal, magazine, or newspaper
  s (series) the title applies to a series of otherwise distinct
  publications such as a collection
  u (unpublished) the title applies to any unpublished material
  (including theses and dissertations unless published by a
  commercial press)
Note The level of a title is sometimes implied by its context: for
example, a title appearing directly within an <analytic> element
is ipso facto of level a, and one appearing within a <series>
element of level s. For this reason, the level attribute is not required
in contexts where its value can be unambiguously inferred. Where
it is supplied in such contexts, its value should not contradict the
value implied by its parent element.

class character data

Note The attributes key and ref, inherited from the class att.canonical may be used to
indicate the canonical form for the title; the former, by supplying (for example) the
identifier of a record in some external library system; the latter by pointing to an
XML element somewhere containing the canonical form of the title.

Example

<title>Information Technology and the Research Process: Proceedings of
a conference held at Cranfield Institute of Technology, UK,
18–21 July 1989</title>

Example

<title>Hardy's Tess of the D'Urbervilles: a machine readable
edition</title>

Example

<title type="full">
<title type="main">Synthèse</title>
<title type="sub">an international journal for
epistemology, methodology and history of
science</title>
</title>

    <classRef key="model.inter"/>
    <classRef key="model.lLike"/>
    <classRef key="model.global"/>
  </alternate>
</content>
```

Schema Declaration

```xml
element trailer {
  att.global.attributes, att.typed.attributes, att.placement.attributes, att.written.attributes, {
    text
    | lg | model.gLike | model.phrase | model.inter | model.lLike | model.global
  }
}
```

<unclear> contains a word, phrase, or passage which cannot be transcribed with certainty because it is illegible or inaudible in the source. [11.3.3.1. Damage, Illegibility, and Supplied Text 3.4.3. Additions, Deletions, and Omissions]

Module core

Attributes

<table>

</tr>
</tbody>
</table>

@reason indicates why the material is hard to transcribe.

Status Optional

Datatype 1–∞ occurrences of `teidata.enumerated` separated by whitespace

Suggested values include: illegible

inaudible
faded
background_noise
eccentric_ductus
Note One or more words may be used to describe the reason; usually each word will refer to a single cause.

@agent Where the difficulty in transcription arises from damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype teidata.enumerated

Sample values include: rubbing damage results from rubbing of the leaf edges

mildew damage results from mildew on the leaf surface

smoke damage results from smoke

Example
...and then <unclear reason="background-noise">Nathalie</unclear> said ... </u>

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml

Note This class of elements can occur within paragraphs, list items, lines of verse, etc.

model.phrase.xml groups phrase-level elements used to encode XML constructs such as element names, attribute names, and attribute values [22. Documentation Elements]

_module tei
_used by model.limitedPhrase model.phrase
_members att gi val

model.placeStateLike groups elements which describe changing states of a place.

_module tei
**model.profileDescPart** groups elements which may be used inside `<profileDesc>` and appear multiple times.

*Module* tei

*Used by* profileDesc

*Members* creation langUsage textClass

**model.ptrLike** groups elements used for purposes of location and reference. [3.6. Simple Links and Cross-References]

*Module* tei

*Used by* bibl cit model.limitedPhrase model.phrase model.publicationStmtPart.detail

*Members* ptr ref

**model.publicationStmtPart.agency** groups the child elements of a `<publicationStmt>` element of the TEI header that indicate an authorising agent. [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei

*Used by* publicationStmt

*Members* authority distributor publisher

*Note* The agency child elements, while not required, are required if one of the detail child elements is to be used. It is not valid to have a detail child element without a preceding agency child element.

See also **model.publicationStmtPart.detail**.

**model.publicationStmtPart.detail** groups the agency-specific child elements of the `<publicationStmt>` element of the TEI header. [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei

*Used by* publicationStmt

*Members* model.ptrLike ptr ref address availability date idno pubPlace

*Note* A detail child element may not occur unless an agency child element precedes it.

See also **model.publicationStmtPart.agency**.

**model.qLike** groups elements related to highlighting which can appear either within or between chunk-level elements. [3.3. Highlighting and Quotation]

*Module* tei

*Used by* cit macro.phraseSeq model.inter sp

*Members* model.quoteLike cit q

245
A LIST OF ELEMENTS DESCRIBED

**model.quoteLike** groups elements used to directly contain quotations.

*Module* tei

*Used by* model.qLike

*Members* cit

**model.resource** groups separate elements which constitute the content of a digital resource, as opposed to its metadata. [1.3. The TEI Class System]

*Module* tei

*Used by* TEI teiCorpus

*Members* text

**model.respLike** groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.

*Module* tei

*Used by* editionStmt model.biblPart titleStmt

*Members* author editor funder principal respStmt sponsor

**model.segLike** groups elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories]

*Module* tei

*Used by* bibl model.phrase

*Members* pc s seg w

*Note* The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the `<segmentation>` element of the `<encodingDesc>` within the associated TEI header.

**model.stageLike** groups elements containing stage directions or similar things defined by the module for performance texts. [7.3. Other Types of Performance Text]

*Module* tei

*Used by* lg model.inter sp

*Members* stage

*Note* Stage directions are members of class inter: that is, they can appear between or within component-level elements.

**model.teiHeaderPart** groups high level elements which may appear more than once in a TEI header.

*Module* tei

*Used by* teiHeader

*Members* encodingDesc profileDesc
**model.titlepagePart** groups elements which can occur as direct constituents of a title page, such as `<docTitle>`, `<docAuthor>`, `<docImprint>`, or `<epigraph>`. [4.6. Title Pages]

**Module tei**

**Used by** `titlePage`

**Members** `argument` `byline` `docAuthor` `docDate` `docEdition` `docImprint` `docTitle` `epigraph` `graphic` `imprimatur` `titlePart`

### A.3 Attribute classes

**att.ascribed** provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

**Module tei**

**Members** `att.ascribed.directed` `q` `sp` `stage` `change`

**Attributes**

- `@who` indicates the person, or group of people, to whom the element content is ascribed.

  **Status** Optional

  **Datatype** `1–∞ occurrences of teidata.pointer separated by whitespace`

  In the following example from Hamlet, speeches (`<sp>`) in the body of the play are linked to `<castItem>` elements in the `<castList>` using the `who` attribute. `<castItem type="role"> <role xml:id="Barnardo">Bernardo</role> </castItem>`

  `<castItem type="role"> <role xml:id="Francisco">Francisco</role> <roleDesc>a soldier</roleDesc> </castItem>`

  `<sp who="#Barnardo"> <speaker>Bernardo</speaker> <l n="1">Who’s there? </l> </sp>`

  `<sp who="#Francisco"> <speaker>Francisco</speaker> <l n="2">Nay, answer me: stand, and unfold yourself. </l> </sp>`

  **Note** For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified `<person>` element.

**att.ascribed.directed** provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

**Module tei**

**Members** `q` `sp` `stage`

**Attributes**

`att.ascribed` (`@who`)
A LIST OF ELEMENTS DESCRIBED

@toWhom indicates the person, or group of people, to whom a speech act or action is directed.

**Status** Optional

**Datatype** 1–∞ occurrences of `teidata.pointer` separated by whitespace

In the following example from Mary Pix’s The False Friend, speeches `<sp>` in the body of the play are linked to `<castItem>` elements in the `<castList>` using the `toWhom` attribute, which is used to specify who the speech is directed to. Additionally, the `<stage>` includes `toWhom` to indicate the directionality of the action. `<castItem type="role">`<role xml:id="emil">Emilius.</role>`<castItem type="role">`<role xml:id="lov">Lovisa</role>`<castItem type="role">`<role xml:id="serv">A servant</role>`<sp who="#emil" toWhom="#lov">Emil.</sp>`<sp who="#lov" toWhom="#emil">Lov.</sp>`<sp who="#emil" toWhom="#lov">Emil.</sp>`<sp who="#lov" toWhom="#emil">Lov.</sp>`

Note To indicate the recipient of written correspondence, use the elements used in section 2.4.6. Correspondence Description, rather than a `toWhom` attribute.

**att.breaking** provides an attribute to indicate whether or not the element concerned is considered to mark the end of an orthographic token in the same way as whitespace.

rendum hƿæt me þæpeorðode puldres ealdor ofer...</ab>

**att.cReferencing** provides an attribute which may be used to supply a **canonical reference** as a means of identifying the target of a pointer.

**Module** tei

**Members** gloss ptr ref term

**Attributes**

- **@cRef** (canonical reference) specifies the destination of the pointer by supplying a canonical reference expressed using the scheme defined in a `<refsDecl>` element in the TEI header

  **Status** Optional

  **Datatype** teidata.text

  **Note** The value of cRef should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.

  The `<refsDecl>` to use may be indicated with the **decls** attribute.

  Currently these Guidelines only provide for a single canonical reference to be encoded on any given `<ptr>` element.

**att.canonical** provides attributes which can be used to associate a representation such as a name or title with canonical information about the object being named or referenced. [13.1.1. Linking Names and Their Referents]

**Module** tei

**Members** att.naming|att.personal|name| author|editor|pubPlace|rs|authority|catDesc|date| distributor| docAuthor|docTitle|funder|principal|publisher|resp|respStmt| sponsor| term|time|title

**Attributes**

- **@key** provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind.

  **Status** Optional

  **Datatype** teidata.text

  `<author>`

  `<name key="Hugo, Victor (1802-1885)"
  ref="http://www.idref.fr/026927608">Victor Hugo</name>`

  `</author>`

  **Note** The value may be a unique identifier from a database, or any other externally-defined string identifying the referent.
No particular syntax is proposed for the values of the key attribute, since its form will depend entirely on practice within a given project. For the same reason, this attribute is not recommended in data interchange, since there is no way of ensuring that the values used by one project are distinct from those used by another. In such a situation, a preferable approach for magic tokens which follows standard practice on the Web is to use a ref attribute whose value is a tag URI as defined in RFC 4151.

@ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note The value must point directly to one or more XML elements or other resources by means of one or more URIs, separated by whitespace. If more than one is supplied the implication is that the name identifies several distinct entities.

att.citing provides attributes for specifying the specific part of a bibliographic item being cited. [1.3.1. Attribute Classes]

Module tei

Members biblScope

Attributes Attributes

@unit identifies the unit of information conveyed by the element, e.g. columns, pages, volume, entry.

Status Optional

Datatype teidata.enumerated

Suggested values include: volume the element contains a volume number.

issue the element contains an issue number, or volume and issue numbers.

page the element contains a page number or page range.

line the element contains a line number or line range.

chapter the element contains a chapter indication (number and/or title)

part the element identifies a part of a book or collection.

column the element identifies a column.

entry the element identifies an entry number or label in a list of entries.

@from specifies the starting point of the range of units indicated by the unit attribute.

Status Optional

Datatype teidata.word

@to specifies the end-point of the range of units indicated by the unit attribute.

Status Optional

Datatype teidata.word
att.datable provides attributes for normalization of elements that contain dates, times, or datable events. [3.5.4. Dates and Times 13.3.7. Dates and Times]

**Module** tei

**Members** change creation date idno licence name resp time title

**Attributes** Attributes att.datable.w3c (@when)

@period supplies a pointer to some location defining a named period of time within which the datable item is understood to have occurred.

*Status* Optional

*Datatype* teidata.pointer

This superclass provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.datable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.datable.iso and att.datable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

---

att.datable.w3c provides attributes for normalization of elements that contain datable events conforming to the W3C XML Schema Part 2: Datatypes Second Edition. [3.5.4. Dates and Times 13.3.7. Dates and Times]

**Module** tei

**Members** att.datable

**Attributes** Attributes

@when supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.

*Status* Optional

*Datatype* teidata.temporal.w3c

Examples of W3C date, time, and date & time formats.

```xml
<p>
<date when="1945-10-24">24 Oct 45</date>
<date when="1996-09-24T07:25:00Z">September 24th, 1996 at 3:25 in the morning</date>
<time when="1999-01-04T20:42:00-05:00">Jan 4 1999 at 8 pm</time>
<time when="14:12:38">fourteen twelve and 38 seconds</time>
<date when="1962-10">October of 1962</date>
<date when="06-12">June 12th</date>
<date when="01">the first of the month</date>
<date when="08">August</date>
<date when="2006">MMVI</date>
<date when="0056">AD 56</date>
<date when="-0056">56 BC</date>
</p>
```

This list begins in the year 1632, more precisely on Trinity Sunday, i.e. the Sunday after Pentecost, in that year the <date calendar="#julian" when="1632-06-06">27th of May (old style)</date>.

<opener>
<dateline>
<placeName>Dorchester, Village</placeName>
<date when="1828-03-02">March 2d. 1828</date>
</dateline>
A LIST OF ELEMENTS DESCRIBED

To Mrs. Cornell,
Sunday noon.

Schematron <sch:rule context="tei:*[@when]">  
  <sch:report test="@notBefore|@notAfter|@from|@to" role="nonfatal">The @when attribute cannot be used with any other att.datable.w3c attributes.</sch:report> </sch:rule>

Schematron <sch:rule context="tei:*[@from]">  
  <sch:report test="@notBefore" role="nonfatal">The @from and @notBefore attributes cannot be used together.</sch:report> </sch:rule>

Schematron <sch:rule context="tei:*[@to]">  
  <sch:report test="@notAfter" role="nonfatal">The @to and @notAfter attributes cannot be used together.</sch:report> </sch:rule>

Example

<date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date>

Note The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar.

The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy, -mm, ---dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.

Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.

att.datcat provides the dcr:datcat and dcr:ValueDatcat attributes which are used to align XML elements or attributes with the appropriate Data Categories (DCs) defined by the ISO 12620:2009 standard and stored in the Web repository called ISOCat at http://www.isocat.org/. [9.5.2. Lexical View 18.3. Other Atomic Feature Values]

Module tei

Members att.segLike pc s seg w

Attributes Attributes

@datcat contains a PID (persistent identifier) that aligns the given element with the appropriate Data Category (or categories) in ISOcat.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

@valueDatcat contains a PID (persistent identifier) that aligns the content of the given element or the value of the given attribute with the appropriate simple Data Category (or categories) in ISOcat.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Example In this example dcr:datcat relates the feature name to the data category "partOfSpeech" and dcr:valueDatcat the feature value to the data category "commonNoun". Both these data categories reside in the ISOcat DCR at www.isocat.org, which is the DCR used by ISO TC37 and hosted by its registration authority, the MPI for Psycholinguistics in Nijmegen.
Note ISO 12620:2009 is a standard describing the data model and procedures for a Data Category Registry (DCR). Data categories are defined as elementary descriptors in a linguistic structure. In the DCR data model each data category gets assigned a unique Persistent IDentifier (PID), i.e., an URI. Linguistic resources or preferably their schemas that make use of data categories from a DCR should refer to them using this PID. For XML-based resources, like TEI documents, ISO 12620:2009 normative Annex A gives a small Data Category Reference XML vocabulary (also available online at http://www.isocat.org/12620/), which provides two attributes, `dcr:datcat` and `dcr:valueDatcat`.

**att.declarable** provides attributes for those elements in the TEI header which may be independently selected by means of the special purpose `decls` attribute. [15.3. Associating Contextual Information with a Text]

**att.declaring** provides attributes for elements which may be independently associated with a particular declarable element within the header, thus overriding the inherited default for that element. [15.3. Associating Contextual Information with a Text]
A LIST OF ELEMENTS DESCRIBED

The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text.

att.dimensions provides attributes for describing the size of physical objects.

Module: tei
Members: add, date, del, gap, time, unclear
Attributes: @unit, @quantity, @extent, @precision, @scope

- @unit names the unit used for the measurement
  Status: Optional
  Datatype: teidata.enumerated
  Suggested values include: cm (centimetres)
  mm (millimetres)
  in (inches)
  line (lines of text)
  char (characters) characters of text

- @quantity specifies the length in the units specified
  Status: Optional
  Datatype: teidata.numeric

- @extent indicates the size of the object concerned using a project-specific vocabulary combining quantity and units in a single string of words.
  Status: Optional
  Datatype: teidata.text

- @precision characterizes the precision of the values specified by the other attributes.
  Status: Optional
  Datatype: teidata.certainty

- @scope where the measurement summarizes more than one observation, specifies the applicability of this measurement.
  Status: Optional
  Datatype: teidata.enumerated
  Sample values include: all measurement applies to all instances.
  most measurement applies to most of the instances inspected.
  range measurement applies to only the specified range of instances.

att.divLike provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]
Legal values are: **composite** no claim is made about the sequence in which the immediate contents of this division are to be processed, or their inter-relationships.  
**uniform** the immediate contents of this element are regarded as forming a logical unit, to be processed in sequence. [Default]

@sample indicates whether this division is a sample of the original source and if so, from which part.  
*Status* Optional  
*Datatype* `teidata.enumerated`  
Legal values are: **initial** division lacks material present at end in source.  
**medial** division lacks material at start and end.  
**final** division lacks material at start.  
**unknown** position of sampled material within original unknown.  
**complete** division is not a sample. [Default]

--

**att.docStatus** provides attributes for use on metadata elements describing the status of a document.  
*Module* tei  
*Members* `bibl` `change` `revisionDesc`  
*Attributes* Attributes  
@status describes the status of a document either currently or, when associated with a dated element, at the time indicated.  
*Status* Optional  
*Datatype* `teidata.enumerated`  
*Sample values include*: **approved**  
candidate  
cleared  
deprecated  
draft [Default]  
embargoed  
expired  
frozen  
galley  
proposed  
published  
recommendation  
submitted  
unfinished  
withdrawn

*Example*  

```
<revisionDesc status="published">  
<change when="2010-10-21"  
    status="published"/>
<change when="2010-10-02" status="cleared"/>
<change when="2010-08-02"
```

255
att.editLike provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [3.4. Simple Editorial Changes 10.3.1. Origination 13.3.2. The Person Element 11.3.1. Core Elements for Transcriptional Work]

Module tei

Members att.transcriptional\[\text{add } \text{del } \text{corr } \text{date } \text{expan } \text{gap } \text{name } \text{reg } \text{time } \text{unclear} \]

Attributes

@evidence indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: internal there is internal evidence to support the intervention.

external there is external evidence to support the intervention.

conjecture the intervention or interpretation has been made by the editor, cataloguer, or scholar on the basis of their expertise.

@instant indicates whether this is an instant revision or not.

Status Optional

Datatype teidata.xTruthValue

Default false

The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.

Each pointer on the source (if present) corresponding to a witness or witness group should reference a bibliographic citation such as a <witness>, <msDesc>, or <bibl> element, or another external bibliographic citation, documenting the source concerned.

att.edition provides attributes identifying the source edition from which some encoded feature derives.

Module tei

Members lb milestone pb

Attributes

@ed (edition) supplies a sigil or other arbitrary identifier for the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.

Status Optional

Datatype 1–∞ occurrences of teidata.word separated by whitespace
att.fragmentable

@edRef (edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Example

Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit;
Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast;
Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,

Example

<listBibl>
  <bibl xml:id="stapledon1937">
    <author>Olaf Stapledon</author>,
    <title>Starmaker</title>, <publisher>Methuen</publisher>,
    <date>1937</date>
  </bibl>
  <bibl xml:id="stapledon1968">
    <author>Olaf Stapledon</author>,
    <title>Starmaker</title>, <publisher>Dover</publisher>, <date>1968</date>
  </bibl>
</listBibl>

Looking into the future aeons from the supreme moment of the cosmos, I saw the populations still with all their strength maintaining the<pb n="411" edRef="#stapledon1968">essentials of their ancient culture,
still living their personal lives in zest and endless novelty of action, … I saw myself still preserving, though with increasing difficulty, my lucid con-.<pb n="291" edRef="#stapledon1937">sciousness;</p>

att.fragmentable provides an attribute for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

Module tei

Members att.divLike|div|lg att.segLike|pc|seg|w|l|p

Attributes Attributes

@part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.

Status Optional

Datatype teidata.enumerated

Legal values are: Y (yes) the element is fragmented in some (unspecified) respect
N (no) the element is not fragmented, or no claim is made as to its completeness[Default]
I (initial) this is the initial part of a fragmented element
M (medial) this is a medial part of a fragmented element
att.global provides attributes common to all elements in the TEI encoding scheme.

Module tei

Members TEI abbr add addrLine address anchor argument att author authority availability back bibl biblScope body bline catDesc catRef category cell change choice cit classCode classDecl closer code corr creation date dateline del desc distributor div divGen docAuthor docDate docEdition docImprint docTitle editionStmt editor editorialDecl eg emph encodingDesc epigraph expan extent figDesc figure fileDesc foreign formula front funder gap gi gloss graphic group head hi ident idno imprimatur index interp interpGrp item keywords label langUsage language lb lg licence list listBibl mentioned milestone name note notesStmt num opener orig p pb pc postscript principal profileDesc projectDesc ptr pubPlace publicationStmt publisher q ref refsDecl refrelatedItem resp respStmt revisionDesc row rs s salute samplingDecl seg seriesStmt sic signed soCalled sourceDesc sp speaker sponsor stage table taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear val w

Attributes Attributes att.global.rendition (@rend) att.global.linking (@corresp, @next, @prev) att.global.analytic (@ana) att.global.facs (@facs) att.global.responsibility (@cert, @resp) att.global.source (@source)

@xml:id (identifier) provides a unique identifier for the element bearing the attribute.
   Status Optional
   Datatype ID
   Note The xml:id attribute may be used to specify a canonical reference for an element; see section 3.10. Reference Systems.

@n (number) gives a number (or other label) for an element, which is not necessarily unique within the document.
   Status Optional
   Datatype teidata.text
   Note The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

@xml:lang (language) indicates the language of the element content using a tag generated according to BCP 47.
   Status Optional
   Datatype teidata.language

<p>... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">ariki</foreign> or chief (Routledge 1920:205,210) and their connections to ancestral territorial organization.</p>

Note The xml:lang value will be inherited from the immediately
att.global.analytic provides additional global attributes for associating specific analyses or interpretations with appropriate portions of a text. [17.2. Global Attributes for Simple Analyses] [17.3. Spans and Interpretations]
A LIST OF ELEMENTS DESCRIBED

Attributes

@ana (analysis) indicates one or more elements containing interpretations of the element on which the ana attribute appears.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note When multiple values are given, they may reflect either multiple divergent interpretations of an ambiguous text, or multiple mutually consistent interpretations of the same passage in different contexts.

att.global.facs provides an attribute used to express correspondence between an element containing transcribed text and all or part of an image representing that text. [11.1. Digital Facsimiles]

Module transcr

Members att.global TEI abbr add addrLine address anchor argument att author authority availability back bibl biblScope body byline catDesc catRef category cell change choice cit classCode classDecl closer code corr creation date flatline del desc distributor div divGen docAuthor docDate docEdition docImprint docTitle editionStmt editor editorialDecl eg emph encodingDesc epigraph expan extent figDesc figure fileDesc foreign formula front funder gap gi gloss graphic group head hi ident idno imprimatur index interp interpGrp item keywords l label langUsage language lb lg licence list listBibl mentioned milestone name note notesStmt num opener orig p pb pc postscript principal profileDesc projectDesc ptr pubPlace publicationStmt publisher q ref refsDecl reg relatedItem resp respStmt revisionDesc row rs s salute samplingDecl seg seriesStmt sic signed soCalled sourceDesc sp speaker sponsor stage table taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear val w

Attributes

@facsimile (facsimile) points to all or part of an image which corresponds with the content of the element.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

att.global.linking provides a set of attributes for hypertextual linking. [16. Linking, Segmentation, and Alignment]

Module linking

Members att.global TEI abbr add addrLine address anchor argument att author authority availability back bibl biblScope body byline catDesc catRef category cell change choice cit classCode classDecl closer code corr creation date flatline del desc distributor div divGen docAuthor docDate docEdition docImprint docTitle editionStmt editor editorialDecl eg emph encodingDesc epigraph expan extent figDesc figure fileDesc foreign formula front funder gap gi gloss graphic group head hi ident idno imprimatur index interp interpGrp item keywords l label langUsage language lb lg licence list listBibl mentioned milestone name note notesStmt num opener orig p pb pc postscript principal profileDesc projectDesc ptr pubPlace publicationStmt publisher q ref refsDecl reg relatedItem resp respStmt revisionDesc row rs s salute samplingDecl seg seriesStmt sic signed soCalled sourceDesc sp
Attributes Attributes

@corresp (corresponds) points to elements that correspond to the current element in some way.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

```xml
<group>
  <text xml:id="t1-g1-t1" xml:lang="mi">
    <body xml:id="t1-g1-t1-body1">
      <div type="chapter">
        <head>He Whakamaramatanga mo te Ture Hoko, Riihi hoki, i nga Whenua Maori, 1876.</head>
        <p>…</p>
      </div>
    </body>
  </text>
  <text xml:id="t1-g1-t2" xml:lang="en">
    <body xml:id="t1-g1-t2-body1" corresp="#t1-g1-t1-body1">
      <div type="chapter">
        <head>An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.</head>
        <p>…</p>
      </div>
    </body>
  </text>
</group>
```

In this example a `<group>` contains two `<text>`s, each containing the same document in a different language. The correspondence is indicated using `corresp`. The language is indicated using `xml:lang`, whose value is inherited; both the tag with the `corresp` and the tag pointed to by the `corresp` inherit the value from their immediate parent.

```xml
<!-- In a placeography called "places.xml" -->
<place xml:id="LOND1" corresp="people.xml#LOND2 people.xml#GENI1">
  <placeName>London</placeName>
  <desc>The city of London...</desc>
</place>

<!-- In a literary personography called "people.xml" -->
<person xml:id="LOND2" corresp="places.xml#LOND1 #GENI1">
  <persName type="lit">London</persName>
  <note>
    <p>Allegorical character representing the city of London</p>
  </note>
</person>
<person xml:id="GENI1" corresp="places.xml#LOND1 #LOND2">
  <persName type="lit">London’s Genius</persName>
  <note>
    <p>Personification of London’s genius. Appears as an allegorical character in mayoral shows.</p>
  </note>
</person>
```

In this example, a `<place>` element containing information about the city of London is linked with two
A LIST OF ELEMENTS DESCRIBED

<person> elements in a literary personography. This correspondence represents a slightly looser relationship than the one in the preceding example; there is no sense in which an allegorical character could be substituted for the physical city, or vice versa, but there is obviously a correspondence between them.

@next points to the next element of a virtual aggregate of which the current element is part.

Status Optional

Datatype |teidata.pointer|

Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

@prev (previous) points to the previous element of a virtual aggregate of which the current element is part.

Status Optional

Datatype |teidata.pointer|

Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.3. Rendition Indicators]

Module tei

Members att.global|TEI|abbr|add|addrLine|address|anchor|argument|att|author|authority|availability|back|bibl|biblScope|body|byline|catDesc|catRef|category|cell|change|choice|cit|classCode|classDecl|closer|code|corr|creation|date|dateline|del|desc|choice|cit|classCode|classDecl|closer|code|corr|creation|date|dateline|del|desc|choice|cit|classCode|classDecl|closer|code|corr|creation|date|dateline|del|desc|choice|cit|classCode|classDecl|closer|code|corr|creation|date|dateline|del

Attributes

@rend (rendition) indicates how the element in question was rendered or presented in the source text.

Status Optional

Datatype 1–∞ occurrences of teidata.word separated by whitespace

<head rend="align(center) case(allcaps)">
  <lb>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>on Her <lb/>New Blazing-World</hi>.
</head>

Note These Guidelines make no binding recommendations for the values of the rend attribute; the characteristics of visual presentation vary too much from text to text and the decision to record or ignore individual characteristics varies too much from project to project. Some potentially useful conventions are noted from time to time at
att.global.responsibility provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the degree of certainty associated with it. [1.3.1.4. Sources, certainty, and responsibility 3.4. Simple Editorial Changes 11.3.2.2. Hand, Responsibility, and Certainty Attributes 17.3. Spans and Interpretations 13.1.1. Linking Names and Their References]

Module tei

Members att.global TEI abbr add addrLine address anchor argument att author authority availability back bibl biblScope body byline catDesc catRef category cell change choice cit classCode classDecl closer code corr creation date dateline del desc distributor div divGen docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl eg emph encodingDesc epigraph expand extent fgDesc figure fileDesc formula front funder gap gi gloss graphic group head hi ident idno imprimatur index interp internGrp item keywords l label langUsage langUse language lb lg licenced list listBibl mentioned milestone name note notesStmt num opener orig pb pc postscript principal profileDesc projectDesc ptr pubPlace publicationStmt publisher q ref refsDecl resp respStmt revisionDesc row rs s salute samplingDecl seg seriesStmt sic signed soCalled sourceDesc sp speaker sponsor stage table taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear val w

Attributes Attributes

@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.

Status Optional

Datatype teidata.probCert

@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note To reduce the ambiguity of a resp pointing directly to a person or organization, we recommend that resp be used to point not to an agent (<person> or <org>) but to a <respStmt>, <author>, <editor> or similar element which clarifies the exact role played by the agent. Pointing to multiple <respStmt>s allows the encoder to specify clearly each of the roles played in part of a TEI file (creating, transcribing, encoding, editing, proofing etc.).

Example

Blessed are the
<choice>
  <sic>cheesemakers</sic>
  <corr resp="#editor" cert="high">peacemakers</corr>
</choice>: for they shall be called the children of God.

Example
att.global.source provides an attribute used by elements to point to an external source.\[1.3.1.4. Sources, certainty, and responsibility\]\[3.3.3. Quotation\]\[8.3.4. Writing\]

Module: tei

Members: att.global, TEI, abst, add, addrLine, address, anchor, argument, att, author, authority, availability, back, bibl, biblScope, body, byline, catDesc, catRef, category, cell, change, choice, cit, classCode, classDecl, closer, code, corr, creation, date, dateline, del, desc, distributor, div, divGen, docAuthor, docDate, docEdition, docImprint, docTitle, editionStmt, editor, editorialDecl, eg, emph, encodingDesc, epigraph, expan, extent, figDesc, figure, fileDesc, foreign, formula, front, funder, gap, gr, gloss, graphic, group, head, hi, ident, idno, imprimatur, index, interp, interpGrp, item, keywords, 1, label, langUsage, language, lb, lg, licence, list, listBibl, mentioned, milestone, name, note, notesStmt, num, opener, orig, p, pb, pc, postscript, principal, profileDesc, projectDesc, ptr, pubPlace, publicationStmt, publisher, q, ref, refsDecl, reg, relatedItem, resp, respStmt, revisionDesc, row, rs, s, salute, samplingDecl, seg, seriesStmt, sic, signed, soCalled, sourceDesc, sp, speaker, sponsor, stage, table, taxonomy, teiCorpus, teiHeader, term, text, textClass, time, title, titlePage, titlePart, titleStmt, trailer, unclear, val, w

Attributes:

@source specifies the source from which some aspect of this element is drawn.

Status: Optional

Datatype: 1–∞ occurrences of teidata.pointer separated by whitespace

Note: The source attribute points to an external source. When used on elements describing schema components such as <schemaSpec> or <moduleRef> it identifies the source from which declarations for the components of the object being defined may be obtained. On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.

In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, or private scheme URI that is expanded to an absolute URI as documented in a <prefixDef>.

If more than one location is specified, the default assumption is that the required source should be obtained by combining the resources indicated.
Example

<p>
<!-...-->
As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quote source="#mcc_2012">'Collaboration' is a problematic and should be a contested term.</quote>
<!-...-->
</p>

Example

<p>
<!-...-->
<quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote>
<!-...-->
</p>

Example

<elementRef key="p" source="tei:2.0.1"/>

Include in the schema an element named <p> available from the TEI P5 2.0.1 release.

Example

<schemaSpec ident="myODD" source="mycompiledODD.xml">
<!-... further declarations specifying the components required -->
</schemaSpec>

Create a schema using components taken from the file mycompiledODD.xml.

att.interpLike provides attributes for elements which represent a formal analysis or interpretation. [17.2. Global Attributes for Simple Analyses]

Module tei

Members interp interpGrp

Attributes Attributes

@type indicates what kind of phenomenon is being noted in the passage.

Status Recommended

Datatype teidata.enumerated

Sample values include: image identifies an image in the passage.
character identifies a character associated with the passage.
theme identifies a theme in the passage.
allusion identifies an allusion to another text.
@inst (instances) points to instances of the analysis or interpretation represented by the current element.

**Status** Optional

**Datatype** $1–\infty$ occurrences of teidata.pointer separated by whitespace

**Note** The current element should be an analytic one. The element pointed at should be a textual one.

### att.linguistic

att.linguistic provides a set of attributes concerning linguistic features of tokens, for usage within token-level elements, specifically $<w>$ and $<pc>$ in the analysis module. [17.4.2. Lightweight Linguistic Annotation]

**Module** analysis

**Members** pc w

**Attributes** Attributes

- **@lemma** provides a lemma (base form) for the word, typically uninflected and serving both as an identifier (e.g. in dictionary contexts, as a headword), and as a basis for potential inflections.

  **Status** Optional

  **Datatype** teidata.text

  $<w$ lemma="wife">wives</w>
  
  $<w$ lemma="Arznei">Artzeneyen</w>

- **@lemmaRef** provides a pointer to a definition of the lemma for the word, for example in an online lexicon.

  **Status** Optional

  **Datatype** teidata.pointer

  $<w$ type="verb" lemma="hit" lemmaRef="http://www.example.com/lexicon/hitvb.xml">hit</w>

- **@pos** (part of speech) indicates the part of speech assigned to a token (i.e. information on whether it is a noun, adjective, or verb), usually according to some official reference vocabulary (e.g. for German: STTS, for English: CLAWS, for Polish: NKJP, etc.).

  **Status** Optional

  **Datatype** teidata.text

  The German sentence Wir fahren in den Urlaub. tagged with the Stuttgart-Tuebingen-Tagset (STTS).

  $<s$>
  
  $<w$ pos="PPER">Wir</w>
  
  $<w$ pos="VVFIN">fahren</w>
  
  $<w$ pos="APPR">in</w>
  
  $<w$ pos="ART">den</w>
  
  $<w$ pos="NN">Urlaub</w>
  
  $<w$ pos="$.">.</w>
  
  $</s$>

  The English sentence We're going to Brazil. tagged with the CLAWS-5 tagset, arranged inline (with significant whitespace).

  $<p$><w pos="PNP">We</w><w pos="VBB">'re</w><w pos="VVG">going</w><w pos="PRP">to</w></p$>

  The English sentence We're going on vacation to Brazil for a month! tagged with the CLAWS-7 tagset and arranged sequentially.

  $<p$>
We’re going on vacation to Brazil for a month!

@msd (morphosyntactic description) supplies morphosyntactic information for a token, usually according to some official reference vocabulary (e.g. for German: STTS-large tagset; for a feature description system designed as (pragmatically) universal, see Universal Features).

Status: Optional
Datatype: teidata.text

Legal values are:
- no (the token is not adjacent to another)
- left (there is no whitespace on the left side of the token)
- right (there is no whitespace on the right side of the token)
- both (there is no whitespace on either side of the token)
- overlap (the token overlaps with another; other devices (specifying the extent and the area of overlap) are needed to more precisely locate this token in the character stream)

The example below assumes that the lack of whitespace is marked redundantly, by using the appropriate values of join. <s>
<pc join="right">"</pc>
<aw join="left">Friends</aw>
<aw>will</aw>
<aw>be</aw>
<aw join="right">friends</aw>
<pc join="both">."</pc>
<pc join="left">"</pc>
</s>Note that a project may make a decision to only indicate lack of whitespace in one direction, or do that non-redundantly. The existing proposal is the broadest.
possible, on the assumption that we adopt the "streamable view", where all the information on the current element needs to be represented locally.

The English sentence We're going on vacation. tagged with the CLAWS-5 tagset, arranged sequentially, tagged on the assumption that only the lack of the preceding whitespace is indicated. <p>
<w pos="PNP">We</w>
<w pos="VBB" join="left">'re</w>
<w pos="VVG">going</w>
<w pos="PRP">on</w>
<w pos="NN1">vacation</w>
<pc pos="PUN" join="left">.</pc>
</p>

These attributes make it possible to encode simple language corpora and to add a layer of linguistic information to any tokenized resource. See section 17.4.2. Lightweight Linguistic Annotation for discussion.

**att.media** provides attributes for specifying display and related properties of external media.

*Module* tei

*Members* graphic

*Attributes*

**Attributes**

- **@width** Where the media are displayed, indicates the display width
  - **Status**: Optional
  - **Datatype**: teidata.outputMeasurement

- **@height** Where the media are displayed, indicates the display height
  - **Status**: Optional
  - **Datatype**: teidata.outputMeasurement

- **@scale** Where the media are displayed, indicates a scale factor to be applied when generating the desired display size
  - **Status**: Optional
  - **Datatype**: teidata.numeric

**att.milestoneUnit** provides an attribute to indicate the type of section which is changing at a specific milestone. [3.10.3. Milestone Elements 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration]

*Module* core

*Members* milestone

*Attributes*

- **@unit** provides a conventional name for the kind of section changing at this milestone.
  - **Status**: Required
  - **Datatype**: teidata.enumerated
  - **Suggested values include**: page physical page breaks (synonymous with the `<pb>` element).
  - **column** column breaks.
line  line breaks (synonymous with the `<lb>` element).
book  any units termed book, liber, etc.
poem  individual poems in a collection.
canto  cantos or other major sections of a poem.
speaker  changes of speaker or narrator.
stanza  stanzas within a poem, book, or canto.
act  acts within a play.
scene  scenes within a play or act.
section  sections of any kind.
absent  passages not present in the reference edition.
unnumbered  passages present in the text, but not to be included
    as part of the reference.

<milestone n="23"
    ed="La"
    unit="Dreissiger"/>
...
<milestone n="24"
    ed="AV"
    unit="verse"/> ...

Note  If the milestone marks the beginning of a piece of text not
    present in the reference edition, the special value absent
    may be used as the value of unit. The normal interpretation
    is that the reference edition does not contain the text
    which follows, until the next `<milestone>` tag for the
edition in question is encountered.
In addition to the values suggested, other terms may be
    appropriate (e.g. Stephanus for the Stephanus numbers in
Plato).
The type attribute may be used to characterize the unit
    boundary in any respect other than simply identifying the
    type of unit, for example as word-breaking or not.

att.naming  provides attributes common to elements which refer to named persons,
    places, organizations etc. [3.5.1. Referring Strings 13.3.6. Names and Nyms]
Module  tei
Members  att.personal, name, author, editor, pubPlace
Attributes  Attributes  att.canonical (@key, @ref)
@role  may be used to specify further information about the entity referenced by
    this name in the form of a set of whitespace-separated values, for example
    the occupation of a person, or the status of a place.
Status  Optional
Datatype  1–∞ occurrences of teidata.enumerated separated by
    whitespace
@nymRef (reference to the canonical name) provides a means of locating the
    canonical form (nym) of the names associated with the object named by the
element bearing it.
Status  Optional
Datatype  1–∞ occurrences of teidata.pointer separated by whitespace
Note  The value must point directly to one or more XML elements by
    means of one or more URIs, separated by whitespace. If more than
one is supplied, the implication is that the name is associated with several distinct canonical names.

**att.notated** provides an attribute to indicate any specialised notation used for element content.

*Module* `tei`

*Members* `formula` `seg` `w`

*Attributes*

- `@notation` names the notation used for the content of the element.
  - *Status*: Optional
  - *Datatype*: `teidata.enumerated`

**att.personal** (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names]

*Module* `tei`

*Members* `name`

*Attributes*

- `att.naming` (@role, @nymRef) `att.canonical` (@key, @ref)

- `@full` indicates whether the name component is given in full, as an abbreviation or simply as an initial.
  - *Status*: Optional
  - *Datatype*: `teidata.enumerated`

- *Legal values are:* `yes` the name component is spelled out in full.[Default] `abb` (abbreviated) the name component is given in an abbreviated form. `init` (initial letter) the name component is indicated only by one initial.

- `@sort` specifies the sort order of the name component in relation to others within the name.
  - *Status*: Optional
  - *Datatype*: `teidata.count`

**att.placement** provides attributes for describing where on the source page or object a textual element appears. [3.4.3. Additions, Deletions, and Omissions][113.1.4. Additions and Deletions]

*Module* `tei`

*Members* `add` `figure` `head` `label` `note` `stage` `trailer`

*Attributes*

- `@place` specifies where this item is placed.
  - *Status*: Recommended
  - *Datatype*: 1–∞ occurrences of `teidata.enumerated` separated by whitespace

  *Suggested values include:* `below` below the line
att.pointing

bottom at the foot of the page
margin in the margin (left, right, or both)
top at the top of the page
opposite on the opposite, i.e. facing, page
overleaf on the other side of the leaf
above above the line
end at the end of e.g. chapter or volume.
inline within the body of the text.
inspace in a predefined space, for example left by an earlier scribe.

<add place="margin">[An addition written in the margin]</add>
<add place="bottom opposite">[An addition written at the foot of the current page and also on the facing page]</add>
<note place="bottom">Ibid, p.7</note>

att.pointing provides a set of attributes used by all elements which point to other elements by means of one or more URI references. [1.3.1.2. Language Indicators 3.6. Simple Links and Cross-References]

Module tei
Members catRef gloss licence note ptr ref term
Attributes Attributes
@targetLang specifies the language of the content to be found at the destination referenced by target, using a language tag generated according to BCP 47.
Status Optional
Datatype teidata.language

Schematron

<sch:rule context="tei:*[not(tei:schemaSpec)][@targetLang]">
    <sch:assert test="@target">@targetLang should only be used on
    <sch:name/> if @target is specified.</sch:assert>
</sch:rule>

<linkGrp xml:id="pol-swh_aln_2.1-linkGrp">
    <ptr xml:id="pol-swh_aln_2.1.1-ptr"
          target="pol/UDHR/text.xml#pol_txt_1-head"
          type="tuv"
          targetLang="pl"/>
    <ptr xml:id="pol-swh_aln_2.1.2-ptr"
          target="swh/UDHR/text.xml#swh_txt_1-head"
          type="tuv"
          targetLang="sw"/>
</linkGrp>

In the example above, the <linkGrp> combines pointers at parallel fragments of the Universal Declaration of Human Rights: one of them is in Polish, the other in Swahili.

Note The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <language> element with a matching value for its ident attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@target specifies the destination of the reference by supplying one or more URI References
A LIST OF ELEMENTS DESCRIBED

Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium.

@evaluate specifies the intended meaning when the target of a pointer is itself a pointer.
Status Optional
Datatype teidata.enumerated

Legal values are:

all if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.

one if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.

none no further evaluation of targets is carried out beyond that needed to find the element specified in the pointer’s target.

Note If no value is given, the application program is responsible for deciding (possibly on the basis of user input) how far to trace a chain of pointers.

att.ranging provides attributes for describing numerical ranges.

Module tei
Members att.dimensions[add date del gap time unclear] num

Attributes

@atLeast gives a minimum estimated value for the approximate measurement.
Status Optional
Datatype teidata.numeric

@atMost gives a maximum estimated value for the approximate measurement.
Status Optional
Datatype teidata.numeric

@min where the measurement summarizes more than one observation or a range, supplies the minimum value observed.
Status Optional
Datatype teidata.numeric

@max where the measurement summarizes more than one observation or a range, supplies the maximum value observed.
Status Optional
Datatype teidata.numeric

@confidence specifies the degree of statistical confidence (between zero and one) that a value falls within the range specified by min and max, or the proportion of observed values that fall within that range.
Status Optional
Datatype teidata.probability

Example
att.resourced provides attributes by which a resource (such as an externally held media file) may be located.

Module tei
Members graphic
Attributes Attributes
@url (uniform resource locator) specifies the URL from which the media concerned may be obtained.
Status Required
Datatype teidata.pointer

att.segLikelike provides attributes for elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories]

Module tei
Members pc s seg w
Attributes Attributes att.datcat (@datcat, @valueDatcat) att.fragmentable (@part)
@function characterizes the function of the segment.
Status Optional
Datatype teidata.enumerated
Note Attribute values will often vary depending on the type of element to which they are attached. For example, a <cl>, may take values such as coordinate, subject, adverbial etc. For a <phr>, such values as subject, predicate etc. may be more appropriate. Such constraints will typically be implemented by a project-defined customization.

att.sortable provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [9.1. Dictionary Body and Overall Structure]

Module tei
Members bibl idno item list listBibl term
Attributes Attributes
@sortKey supplies the sort key for this element in an index, list or group which contains it.
Status Optional
Datatype teidata.word

David's other principal backer, Josiah ha-Kohen <index indexName="NAMES">
<term sortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</term>
A LIST OF ELEMENTS DESCRIBED

b. Azarya, son of one of the last gaons of Sura was David’s own first cousin.

Note The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produce the desired order; specifics of sort key construction are application-dependent.

Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under fourth, and McCoy may be alphabetized under maccvoy, while A1, A4, and A5 may all appear in numeric order alphabetized between a- and AA. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.

att.spanning provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [11.3.1.4. Additions and Deletions 1.3.1.4. Additions and Deletions]

Module tei
Members index lb milestone pb
Attributes Attributes
@spanTo indicates the end of a span initiated by the element bearing this attribute.
Status Optional
Datatype teidata.pointer
Schematron The @spanTo attribute must point to an element following the current element <sch:rule context="tei:*[@spanTo]"> <sch:assert test="id(substring(@spanTo,2)) and following::*[@xml:id=substring(current()/@spanTo,2)]">The element indicated by @spanTo (<sch:value-of select="@spanTo"/>) must follow the current element <sch:name/> <sch:assert> <sch:name/>

The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the spanTo attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.

att.tableDecoration provides attributes used to decorate rows or cells of a table. [14. Tables, Formulæ, Graphics and Notated Music]

Module figures
Members cell row
Attributes Attributes
@role indicates the kind of information held in this cell or in each cell of this row.
Status Optional
Datatype teidata.enumerated
Suggested values include: **label** labelling or descriptive information only.

**data** data values. [Default]

*Note* When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the *role* attribute of the parent `<row>` element.

@rows indicates the number of rows occupied by this cell or row.

*Status* Optional

*Datatype* |element.count|
*Default* 1

*Note* A value greater than one indicates that this cell spans several rows. Where several cells span multiple rows, it may be more convenient to use nested tables.

@cols (columns) indicates the number of columns occupied by this cell or row.

*Status* Optional

*Datatype* |element.count|
*Default* 1

*Note* A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.

---

**att.timed** provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [§3.5. Temporal Information]

*Module* tei

*Members* gap

*Attributes* Attributes

@start indicates the location within a temporal alignment at which this element begins.

*Status* Optional

*Datatype* |element.pointer|

*Note* If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.

@end indicates the location within a temporal alignment at which this element ends.

*Status* Optional

*Datatype* |element.pointer|

*Note* If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.

---

**att.transcriptional** provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [11.3.1.4. Additions and Deletions]

*Module* tei
A LIST OF ELEMENTS DESCRIBED

Members add del

Attributes Attributes att.editLike (@evidence, @instant) att.written (@hand)

@status indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.

Status Optional
Datatype teidata.enumerated

Sample values include: duplicate all of the text indicated as an addition duplicates some text that is in the original, whether the duplication is word-for-word or less exact.

duplicate-partial part of the text indicated as an addition duplicates some text that is in the original

excessStart some text at the beginning of the deletion is marked as deleted even though it clearly should not be deleted.

excessEnd some text at the end of the deletion is marked as deleted even though it clearly should not be deleted.

shortStart some text at the beginning of the deletion is not marked as deleted even though it clearly should be.

shortEnd some text at the end of the deletion is not marked as deleted even though it clearly should be.

partial some text in the deletion is not marked as deleted even though it clearly should be.

unremarkable the deletion is not faulty. [Default]

Note Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common.

Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.

@cause documents the presumed cause for the intervention.

Status Optional
Datatype teidata.enumerated

@seq (sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.

Status Optional
Datatype teidata.count

att.translatable provides attributes used to indicate the status of a translatable portion of an ODD document.

Module tei

Members desc gloss

Attributes Attributes

@versionDate specifies the date on which the source text was extracted and sent to the translator

Status Optional
**Datatype** | teidata.temporal.w3c
---|---
**Note** | The `versionDate` attribute can be used to determine whether a translation might need to be revisited, by comparing the modification date on the containing file with the `versionDate` value on the translation. If the file has changed, changelogs can be checked to see whether the source text has been modified since the translation was made.

---

**@type** characterizes the element in some sense, using any convenient classification scheme or typology.

**Status** | Optional

**Datatype** | teidata.enumerated

```
<div type="verse">
  <head>Night in Tarras</head>
  <lg type="stanza">
    <l>At evening tramping on the hot white road</l>
    <l>…</l>
  </lg>
  <lg type="stanza">
    <l>A wind sprang up from nowhere as the sky</l>
    <l>…</l>
  </lg>
</div>
```

**Note** | The `type` attribute is present on a number of elements, not all of which are members of `att.typed`, usually because these elements restrict the possible values for the attribute in a specific way.

**@subtype** provides a sub-categorization of the element, if needed

**Status** | Optional

**Datatype** | teidata.enumerated

**Note** | The `subtype` attribute may be used to provide any sub-classification for the element additional to that provided by its `type` attribute.

**Schematron** | `<sch:rule context="tei:*[@subtype]"> <sch:assert test="@type">The
A LIST OF ELEMENTS DESCRIBED

<sch:name/> element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert> </sch:rule>

Note When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <valList> element in the project-specific schema description, as described in 23.3.1.3. Modification of Attribute and Attribute Value Lists.

att.written provides an attribute to indicate the hand in which the content of an element was written in the source being transcribed. [1.3.1. Attribute Classes]

Module tei
Members  

Attributes  Attributes

@hand points to a <handNote> element describing the hand considered responsible for the content of the element concerned.

Status Optional

Datatype teidata.pointer

A.4 Macros

macro.limitedContent (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]

A.5 Datatypes

teidata.certainty defines the range of attribute values expressing a degree of certainty.

Module tei
Used by teidata.probCert

Content model

Declaration

teidata.certainty = { high | medium | low }

280
teidata.count

<valItem ident="low"/>
<valItem ident="unknown"/>
</valList>
</content>

Declaration

\texttt{teidata.certainty = "high" | "medium" | "low" | "unknown"}

Note Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

\textbf{teidata.count} defines the range of attribute values used for a non-negative integer value used as a count.

\textbf{Module} tei

\textbf{Used by} Element:
- table/@rows
- table/@cols

\textbf{Content model}

\begin{verbatim}
<content>
<dataRef name="nonNegativeInteger"/>
</content>
\end{verbatim}

\textbf{Declaration} \texttt{teidata.count = xsd:nonNegativeInteger}

\textbf{Note} Any positive integer value or zero is permitted

\textbf{teidata.duration.iso} defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats

\textbf{Module} tei

\textbf{Used by} Content model

\begin{verbatim}
<content>
<dataRef name="token"
    restriction="[0-9,.DHMPRSTWYZ/:+-]+"/>
</content>
\end{verbatim}

\textbf{Declaration}

\texttt{teidata.duration.iso = token { pattern = "[0-9,.DHMPRSTWYZ/:+-]+" } }

\textbf{Example}

\begin{verbatim}
<time dur-iso="PT0,75H">three-quarters of an hour</time>
\end{verbatim}

\textbf{Example}
A L I S T  O F  E L E M E N T S  D E S C R I B E D

<date dur-iso="P1,5D">a day and a half</date>

Example

<date dur-iso="P14D">a fortnight</date>

Example

<time dur-iso="PT0.02S">20 ms</time>

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see ISO 8601 Data elements and interchange formats — Information interchange — Representation of dates and times.

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.

Module tei

Used by

Content model

<content> <dataRef name="duration"/></content>

Declaration

teidata.duration.w3c = xsd:duration

Example

<time dur="PT45M">forty-five minutes</time>

Example

<date dur="P1DT12H">a day and a half</date>

Example

<date dur="P7D">a week</date>

Example

<time dur="PT0.02S">20 ms</time>

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see the W3C specification.
teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

Module tei

Used by Element:

- abbr/@type
- att/@scheme
- availability/@status
- desc/@type
- divGen/@type
- gap/@reason
- gap/@agent
- gi/@scheme
- idno/@type
- list/@type
- num/@type
- pc/@force
- pc/@unit
- q/@type
- stage/@type
- title/@type
- title/@level
- titlePage/@type
- titlePart/@type
- unclear/@reason
- unclear/@agent

Content model `<content> <dataRef key="teidata.word"/></content>`

Declaration `teidata.enumerated = teidata.word`

Note Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace. Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a `<vallist>` element.

---

**teidata.language** defines the range of attribute values used to identify a particular combination of human language and writing system. [6.1. Language Identification]

Module tei

Used by Element:

- language/@ident

Content model
A LIST OF ELEMENTS DESCRIBED

Declaration

```xml
<content>
  <alternate>
    <dataRef name="language"/>
    <valList>
      <valItem ident=""/>
    </valList>
  </alternate>
</content>
```

Note

The values for this attribute are language tags as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.

A language tag, per BCP 47, is assembled from a sequence of components or subtags separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

- **language** The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at [http://www.iana.org/assignments/language-subtag-registry](http://www.iana.org/assignments/language-subtag-registry). It is recommended that this code be written in lower case.

- **script** The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at [http://unicode.org/iso15924/iso15924-codes.html](http://unicode.org/iso15924/iso15924-codes.html). The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

- **region** Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at [https://www.iso.org/obp/ui/#search/code/](https://www.iso.org/obp/ui/#search/code/). The latter consist of 3 digits; the list of codes can be found at [http://unstats.un.org/unsd/methods/m49/m49.htm](http://unstats.un.org/unsd/methods/m49/m49.htm).

- **variant** An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.

- **extension** An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

- **private use** An extension that uses the initial subtag of the single letter x (i.e., starts with x-) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a
document that makes use of these subtags to be TEI-conformant, a
     corresponding `<language>` element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the
IANA registry that do not match the above syntax, but are present because they
have been grandfathered from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags
start with x-, and do not need to follow any further rules established by the IETF
and endorsed by these Guidelines. Like all language tags that make use of private
use subtags, the language in question must be documented in a corresponding
`<language>` element in the TEI header.

Examples include

- **sn** Shona
- **zh-TW** Taiwanese
- **zh-Hant-HK** Chinese written in traditional script as used in Hong Kong
- **en-SL** English as spoken in Sierra Leone
- **pl** Polish
- **es-MX** Spanish as spoken in Mexico
- **es-419** Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP
47, *Language tags in HTML and XML*.

---

**teidata.name** defines the range of attribute values expressed as an XML Name.

*Module* tei

*Used by* `@indexName`

*Content model* `<content> <dataRef name="Name"/></content>`

*Declaration* `teidata.name = xsd:Name`

*Note* Attributes using this datatype must contain a single word which follows the rules
defining a legal XML name (see [http://www.w3.org/TR/REC-xml/#dt-name](http://www.w3.org/TR/REC-xml/#dt-name)): for example they cannot include whitespace or begin with digits.

---

**teidata.namespace** defines the range of attribute values used to indicate XML
namespaces as defined by the W3C *Namespaces in XML* Technical Recommendation.

*Module* tei

*Used by* `@indexName`

*Content model* `<content> <dataRef name="anyURI"/></content>`

*Declaration* `teidata.namespace = xsd:anyURI`

*Note* The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*.

---

**teidata.numeric** defines the range of attribute values used for numeric values.
A  LIST OF ELEMENTS DESCRIBED

Module tei
Used by Element:

- num/@value

Content model

```xml
<content>
  <alternate>
    <dataRef name="double"/>
    <dataRef name="token"
      restriction="[\-\+]?\d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)="/>
    <dataRef name="decimal"/>
  </alternate>
</content>
```

Declaration

```xml
teidata.numeric =
xsd:double | token { pattern = "[\-\+]?\d+/[\-\+]?\d+" } | xsd:decimal
```

Note  Any numeric value, represented as a decimal number, in floating point format, or as a ratio.
To represent a floating point number, expressed in scientific notation, E notation, a variant of exponential notation, may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.
A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

**teidata.outputMeasurement** defines a range of values for use in specifying the size of an object that is intended for display.

Module tei
Used by

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[\-\+]?\d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)="/>
</content>
```

Declaration

```xml
teidata.outputMeasurement =
token {
  pattern = "[\-\+]?\d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"
}
```
teidata.pattern defines attribute values which are expressed as a regular expression.

Module tei

Used by

Content model `<content> <dataRef name="token"/></content>`

Declaration `teidata.pattern = token`

Note A regular expression, often called a *pattern*, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings *Handel*, *Händel*, and *Haendel* can be described by the pattern `H(ä|ae?)ndel` (or alternatively, it is said that the pattern `H(ä|ae?)ndel` matches each of the three strings) [Wikipedia](https://en.wikipedia.org/wiki/Regular_expression).

This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.

---

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei

Used by Element:

- `catRef/@scheme`
- `change/@target`
- `classCode/@scheme`
- `keywords/@scheme`
- `note/@targetEnd`
- `relatedItem/@target`

Content model `<content> <dataRef name="anyURI"/></content>`

Declaration `teidata.pointer = xsd:anyURI`

Note The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*. Note that the values themselves are encoded using...
A LIST OF ELEMENTS DESCRIBED

**teidata.probCert** defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

*Module* tei  
*Used by* teidata.probCert  
*Content model*  

```xml
<content>
  <alternate>
    <dataRef key="teidata.probability"/>
    <dataRef key="teidata.certainty"/>
  </alternate>
</content>
```

*Declaration*  

```
teidata.probCert = teidata.probability | teidata.certainty
```

**teidata.probability** defines the range of attribute values expressing a probability.

*Module* tei  
*Used by* teidata.probCert  
*Content model*  

```xml
<content> <dataRef name="double"/></content>
```

*Declaration*  

```
teidata.probability = xsd:double
```

*Note* Probability is expressed as a real number between 0 and 1; 0 representing *certainly false* and 1 representing *certainly true*.

**teidata.replacement** defines attribute values which contain a replacement template.

*Module* tei  
*Used by* teidata.probCert  
*Content model*  

```xml
<content> <textNode/></content>
```

*Declaration*  

```
teidata.replacement = text
```

**teidata.temporal.w3c** defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

*Module* tei  
*Used by* docDate/@when
Content model

```xml
<content>
  <alternate>
    <dataRef name="date"/>
    <dataRef name="gYear"/>
    <dataRef name="gMonth"/>
    <dataRef name="gDay"/>
    <dataRef name="gYearMonth"/>
    <dataRef name="gMonthDay"/>
    <dataRef name="time"/>
    <dataRef name="dateTime"/>
  </alternate>
</content>
```

Declaration

```
teidata.temporal.w3c =
  xsd:date
  | xsd:gYear
  | xsd:gMonth
  | xsd:gDay
  | xsd:gYearMonth
  | xsd:gMonthDay
  | xsd:time
  | xsd:dateTime
```

*Note* If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the `dateTime` representation should be used.

**teidata.text** defines the range of attribute values used to express some kind of identifying string as a single sequence of Unicode characters possibly including whitespace.

*Module* tei

*Used by* Content model

*Declaration*

```
teidata.text = string
```

*Note* Attributes using this datatype must contain a single token in which whitespace and other punctuation characters are permitted.

**teidata.truthValue** defines the range of attribute values used to express a truth value.

*Module* tei

*Used by* Element:

- `note/@anchored`
- `pc/@pre`

*Content model*

```
<content> <dataRef name="boolean"/></content>
```

*Declaration*

```
teidata.truthValue = xsd:boolean
```

*Note* The possible values of this datatype are 1 or true, or 0 or false.
A LIST OF ELEMENTS DESCRIBED

This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: data.xTruthValue.

teidata.unboundedInt defines an attribute value which can be either any non-negative integer or the string "unbounded".
Module tei
Used by Content model

```
<content>  <alternate>
    <dataRef name="nonNegativeInteger"/>
    <valList type="closed">
        <valItem ident="unbounded"/>
    </valList>
  </alternate>
</content>
```

Declaration

teidata.unboundedInt = xsd:nonNegativeInteger | ( "unbounded" )

teidata.version defines the range of attribute values which may be used to specify a TEI or Unicode version number.
Module tei
Used by Element:

- teiCorpus/@version

Content model

```
<content>
  <dataRef name="token" restriction="[\d]+(\.\[d\]+){0,2}"/>
</content>
```

Declaration

teidata.version = token { pattern = "[\d]+(\.\[d\]+){0,2}" }

Note The value of this attribute follows the pattern specified by the Unicode consortium for its version number (http://unicode.org/versions/). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.

teidata.versionNumber defines the range of attribute values used for version numbers.
Module tei
teidata.word defines the range of attribute values expressed as a single word or token.

Module tei

**Used by**

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[\d]+[a-zA-Z]*[\d]*([^\d]+[a-zA-Z]*[\d]*){0,3}"/>
</content>
```

**Declaration**

```xml
teidata.versionNumber =
  token { pattern = "[\d]+[a-zA-Z]*[\d]*([^\d]+[a-zA-Z]*[\d]*){0,3}" }
```

**Note** Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

---

teidata.xTruthValue (extended truth value) defines the range of attribute values used to express a truth value which may be unknown.

Module tei

**Used by**

Content model

```xml
<content>
  <alternate>
    <dataRef name="boolean"/>
    <valList>
      <valItem ident="unknown"/>
      <valItem ident="inapplicable"/>
    </valList>
  </alternate>
</content>
```

**Declaration**

```xml
teidata.xTruthValue = xsd:boolean | ( "unknown" | "inapplicable" )
```

**Note** In cases where where uncertainty is inappropriate, use the datatype data.TruthValue.
teidata.xmlName defines attribute values which contain an XML name.

Module tei
Used by

Content model `<content> <dataRef name="NCName"/></content>`

Declaration `teidata.xmlName = xsd:NCName`

Note The rules defining an XML name form a part of the XML Specification.

---

teidata.xpath defines attribute values which contain an XPath expression.

Module tei
Used by

Content model `<content> <textNode/></content>`

Declaration `teidata.xpath = text`

Note Any XPath expression using the syntax defined in XSLT2.

When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.
