An Introduction to TEI simplePrint

Lou Burnard  Martin Mueller  Sebastian Rahtz  James Cummings  Magdalena Turska
January 2017
Preface

This document is the formal specification for TEI simplePrint, an entry-level customization of the Text Encoding Initiative (TEI) Guidelines, intended to be generally useful to a large variety of encoders attempting to cope with the standardized representation of a variety of documents in digital form.

Like every other TEI customization, TEI simplePrint was designed for use with a particular type of material. If the material you are planning to encode matches the following criteria, then TEI simplePrint is for you. If it does not, it may not be.

- You are encoding print material, rather than manuscript: simplePrint provides no way of encoding manuscript features such as correction, deletion, or scribal variation.

- You are encoding material from the Early Modern period (i.e., up to the end of the nineteenth century): some of the features for which simplePrint provides encodings are rarely found in modern materials.

- You are encoding material written, broadly speaking, within the Western European tradition, using largely Western European characters. simplePrint does provide facilities for encoding short passages in non-Western European languages, but many features needed to cope with Asian or ancient scripts are missing.

- Your intention is to provide a relatively simple encoding for a large amount of material, rather than a rich encoding of a small amount of material: simplePrint is intended to help libraries and archives wishing to go beyond basic digital facsimiles, rather than to support specialist research. It does not, for example, include features for detailed linguistic tagging beyond simple word-level tagging, nor for specialised text types such as dictionaries, historical or biographical databases, etc.

If your needs go beyond those summarized here, simplePrint may still be a good point of departure, and may be very useful as a basis for the creation of your own TEI customisation. We don’t however discuss the creation of a TEI customization in this document: the TEI website provides a number of links to tutorial material and tools which may assist in this process.

The present document is intended to be generally comprehensible and accessible, but does assume some knowledge of XML (the encoding language used by the TEI), and of the way it is used by the TEI. Further information on both these topics are available from many places, not least the TEI’s own web site at http://www.tei-c.org.

The TEI simplePrint schema was first elaborated as a part of the TEI Simple project funded by the Andrew W. Mellon Foundation (2012-2014). The project sought to define a new highly-constrained and prescriptive subset of the Text Encoding Initiative (TEI) Guidelines suited to the representation of early modern print materials, a formally-defined set of processing rules which permit modern web applications to easily present and analyze the encoded texts, mapping to other ontologies, and processes to describe the encoding status and richness of a TEI digital text. Its choice of elements reflected the practices followed in the encoding of large-scale literary archives, notably those produced by the Text Creation Partnership. Practice of other comparable archives such as the German Text Archive was also taken into account.

The most distinctive feature of TEI simplePrint is its use of the TEI Processing Model, which provides explicit and recommended options for the display or processing of every textual element. Programmers developing systems to handle texts encoded with TEI simplePrint do not have to look beyond this when building stylesheets or other components. This greatly reduces the complexity of developing applications that will work reliably and consistently for many users and across large corpora of documents.

The TEI simplePrint schema and the TEI Processing Model were first defined by a working group led by Martin Mueller (Northwestern University) and Sebastian Rahtz (Oxford...
University). Major contributions to the project were made by Magdalena Turska (Oxford University), James Cummings (Oxford University), and Brian Pytlik Zillig. The changes to the TEI scheme needed to support the TEI Processing Model were reviewed and approved by the TEI Technical Council for inclusion in release 3.0.0 of TEI P5 in February 2016. The present document was extensively revised and extended by Lou Burnard in July 2016 for submission to the TEI Technical Council.
1 A Short Example

We begin with a short example. How should we go about transferring into a computer a passage of prose, such as the start of the last chapter of Charlotte Brontë’s novel *Jane Eyre*? We might start by simply copying what we see on the printed page, typing it in such a way that what appears on the screen looks as similar as possible, for example, by retaining the original line breaks, by introducing blanks to represent the layout of the original headings, page breaks, and paragraphs, and so forth. Of course, the possibilities are limited by the nature of the computer program we use to capture the text: it may not be possible for example to reflect accurately the typographic characteristics of our source with all such software. Some characters in the printed text (such as the accented letter \(a\) in *fa\(\text{a}\)* or the long dash) may not be available on the keyboard; some typographic distinctions (such as that between small capitals and full capitals) may not be readily accessible. Our first attempt tries to mimic the appearance of the former, and simply ignores the latter.

CHAPTER 38

READER, I married him. A quiet wedding we had: he and I, the parson and clerk, were alone present. When we got back from church, I went into the kitchen of the manor-house, where Mary was cooking the dinner, and John cleaning the knives, and I said --

'Mary, I have been married to Mr Rochester this morning.' The housekeeper and her husband were of that decent, phlegmatic order of people, to whom one may at any time safely communicate a remarkable piece of news without incurring the danger of having one's ears pierced by some shrill ejaculation and subsequently stunned by a torrent of wordy wonderment. Mary did look up, and she did stare at me; the ladle with which she was basting a pair of chickens roasting at the fire, did for some three minutes hang suspended in air, and for the same space of time John's knives also had rest from the polishing process; but Mary, bending again over the roast, said only -- 'Have you, miss? Well, for sure!'

A short time after she pursued, 'I seed you go out with the master, but I didn't know you were gone to church to be wed'; and she basted away. John, when I turned to him, was grinning from ear to ear.

'I telled Mary how it would be,' he said: 'I knew what Mr Edward' (John was an old servant, and had known his master when he was the cadet of the house, therefore he often gave him his Christian name) -- 'I knew what Mr Edward would do; and I was certain he would not wait long either: and he's done right, for aught I know. I wish you joy, miss!' and he politely pulled his forelock.

'Thank you, John. Mr Rochester told me to give you and Mary this.'

I put into his hand a five-pound note. Without waiting to hear more, I left the kitchen. In passing the door of that sanctum some time after, I caught the words --

'She'll happen do better for him nor ony o' t' grand ladies.' And again, 'If she ben't one o' th' handsomest, she's noan faa\(\text{a}\), and varry good-natured; and i' his een she's fair beautiful, onybody may see that.'

I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and Mary approved the step unreservedly. Diana announced that she
A SHORT EXAMPLE

would just give me time to get over the honeymoon, and then she
would come and see me.

'She had better not wait till then, Jane,' said Mr Rochester, when I
read her letter to him; 'if she does, she will be too late, for our honey-
moon will shine our life long; its beams will only fade over your
grave or mine.'

How St John received the news I don't know: he never answered
the letter in which I communicated it: yet six months after he wrote
to me, without, however, mentioning Mr Rochester's name or allud-
ing to my marriage. His letter was then calm, and though very serious,
kind. He has maintained a regular, though not very frequent correspond-
ence ever since: he hopes I am happy, and trusts I am not of those who
live without God in the world, and only mind earthly things.

This transcription suffers from a number of shortcomings:

- the page numbers and running titles are intermingled with the text in a way which makes
  it difficult for software to distinguish them;
- no distinction is made between single quotation marks and apostrophe, so it is difficult to
  be certain exactly which passages are in direct speech;
- the preservation of the copy text’s hyphenation means that simple-minded search programs
  will not find words broken across a line;
- the accented letter in faàl and the long dash have been rendered by ad hoc keying
  conventions (faa\l) which follow no standard pattern and will be processed correctly only
  if the transcriber remembers to mention them in the documentation;
- paragraph divisions are marked only by the use of white space, and hard carriage returns
  have been introduced at the end of each line. Consequently, if the size of type used to
display the text changes, reformattting will be problematic.

We now present the same passage, as it might be encoded in TEI simplePrint. As we shall
see, there are many ways in which this encoding could be extended, but as a minimum, the TEI
approach allows us to represent the following distinctions in a standardized way:

- Paragraph and chapter divisions are now marked explicitly by means of tags rather than
  implicitly by white space.
- Apostrophes are retained, but the quotation marks indicating direct speech have been
  removed, and direct speech is now marked explicitly by means of a tag.
- The accented letter and the long dash are accurately represented, using the appropriate
  Unicode character.
- Page divisions have been marked with an empty \textless\textbackslash pb\textgreater \ tag; the page heading and running
  text have been suppressed.
- The lineation of the original has also been suppressed and words broken by typographic
  accident at the end of a line have been re-assembled without comment.
- For convenience of proof reading, a new line has been introduced at the start of each
  paragraph, but the indentation is removed.
Reader, I married him. A quiet wedding we had: he and I, the parson and clerk, were alone present. When we got back from church, I went into the kitchen of the manor-house, where Mary was cooking the dinner, and John cleaning the knives, and I said —

Mary, I have been married to Mr Rochester this morning. The housekeeper and her husband were of that decent, phlegmatic order of people, to whom one may at any time safely communicate a remarkable piece of news without incurring the danger of having one's ears pierced by some shrill ejaculation and subsequently stunned by a torrent of wordy wonderment. Mary did look up, and she did stare at me; the ladle with which she was basting a pair of chickens roasting at the fire, did for some three minutes hang suspended in air, and for the same space of time John's knives also had rest from the polishing process; but Mary, bending again over the roast, said only —

Have you, miss? Well, for sure!

A short time after she pursued, I seed you go out with the master, but I didn't know you were gone to church to be wed; and she basted away. John, when I turned to him, was grinning from ear to ear. I telled Mary how it would be, he said: I knew what Mr Edward (John was an old servant, and had known his master when he was the cadet of the house, therefore he often gave him his Christian name) — I knew what Mr Edward would do; and I was certain he would not wait long either: and he's done right, for aught I know. I wish you joy, miss! and he politely pulled his forelock.

Thank you, John. Mr Rochester told me to give you and Mary this.

I put into his hand a five-pound note. Without waiting to hear more, I left the kitchen. In passing the door of that sanctum some time after, I caught the words —

She'll happen do better for him nor ony o' t' grand ladies. And again, if she ben't one o' th' handsomest, she's noan faàl, and varry good-natured; and i' his een she's fair beautiful, onybody may see that.

I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and Mary approved the step unreservedly. Diana announced that she would just give me time to get over the honeymoon, and then she would come and see me.
She had better not wait till then, Jane," said Mr Rochester, when I read her letter to him; if she does, she will be too late, for our honeymoon will shine our life long: its beams will only fade over your grave or mine."

How St John received the news I don't know: he never answered the letter in which I communicated it: yet six months after he wrote to me, without, however, mentioning Mr Rochester's name or alluding to my marriage. His letter was then calm, and though very serious, kind. He has maintained a regular, though not very frequent correspondence ever since: he hopes I am happy, and trusts I am not of those who live without God in the world, and only mind earthly things.

This encoding is expressed in TEI XML, a very widely used and standardized method of representing information about a document within the document itself. The transcribed words are complemented by special flags within angle brackets, called tags, which both characterise and mark the beginning and end of a string of characters. For example, each paragraph is marked by a tag <p> at its start, and a corresponding </p> at its end. We don’t elaborate further on the syntax of TEI XML here.

Aside from its syntax, it is important to note that this particular encoding represents a set of choices or priorities. We have chosen to prioritize and simplify the representation of the words of the text over the representation of the typographic layout associated with them in this source document. This makes it easier for a computer to answer questions about the words in the document than about its typesetting, reflecting our research priorities. This priority also leads us to suppress end-of-line hyphenation. Conceivably Brontë (or her printer) intended the word honeymoon to appear as honey-moon on its second appearance, though this seems unlikely: our decision to focus on Brontë’s text, rather than on the printing of it in this particular edition, makes it impossible to be certain. Similarly, our decision makes it impossible to use this transcription as a means of statistically analysing hyphenation practice. An encoding makes explicit all and only those textual features of importance to the encoder.

It is not difficult to think of ways in which the encoding of even this short passage might readily be extended to address other research priorities. For example:

- a regularized form of the passages in dialect could be provided;
- footnotes glossing or commenting on any passage could be added;
- pointers linking parts of this text to others could be added;
- proper names of various kinds could be distinguished from the surrounding text;
- names could be classified as personal, geographical, or institutional;
- detailed bibliographic information about the text’s provenance and context could be prefixed to it;
- a linguistic analysis of the passage into sentences, clauses, words, etc., could be provided, each unit being associated with appropriate category codes;
the text could be segmented into narrative or discourse units;

- systematic analysis or interpretation of the text could be included in the encoding, with potentially complex alignment or linkage between the text and the analysis, or between the text and one or more translations of it;

- passages in the text could be linked to images or sound held on other media.

In the remainder of this document, we present a number of TEI-recommended ways of supporting these and other encoding requirements. These ways generally involve the application of specific TEI XML elements, selected from the full range of possibilities documented in the TEI Guidelines. Like every other TEI project, TEI Simple proposes a view of the TEI Guidelines. This document defines and documents that view.

2 The Structure of a TEI simplePrint Document

A TEI-conformant text contains (a) a TEI header (marked up as a `<teiHeader>` element) and (b) one or more representations of a text. These representations may be of three kinds: a transcribed text, marked up as a `<text>` element; a collection of digital images representing the text, marked up using a `<facsimile>` element; or a literal transcription of one or more documents instantiating the text, marked up using the `<sourceDoc>` element.

These elements are combined together to form a single `<TEI>` element, which must be declared within the TEI namespace, and therefore usually takes the form `<TEI xmlns="http://www.tei-c.org/ns/1.0">`.

Some aspects of the TEI header are described in more detail in section 15. The Electronic Title Page. In what follows, we will focus chiefly on the use of the `<text>` element, though we describe one way of using the `<facsimile>` element in combination with it or alone in section 14. Encoding a Digital Facsimile. We do not consider the `<sourceDoc>` element further, since it is mainly used in very specialised applications for which TEI simplePrint would not be appropriate.

A text may be unitary (a single work) or composite (a collection of single works, such as an anthology). In either case, the text may have optional front or back matter such as title pages, prefaces, appendixes etc. We use the term body for whatever comes between these in the source document. We discuss various kinds of composite text in section 12. Composite and Floating Texts below.

A unitary text will be encoded using an overall structure like this:

```xml
<TEI xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader/>
  <text>
    <front/>
    <body/>
    <back/>
  </text>
</TEI>
```

---

2A namespace is an XML concept. Its function is to identify the vocabulary from which a group of element names are drawn, using a standard identifier resembling a web address. The namespace for TEI elements is http://www.tei-c.org/ns/1.0
3 ENCODING THE BODY

In each of the following sections we include a short list of the TEI elements under discussion, along with a brief description, and in most cases an example of how they are used. Throughout the text, element names are linked to their detailed reference documentation, as given in the TEI Guidelines. Note that most of the examples provided by the reference documentation, and all of the links, are not specific to TEI simplePrint.

For example, here are the elements discussed so far:

<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the model.resource class. Multiple <TEI> elements may be combined within a <TEI> (or <teiCorpus>) element.

<teiHeader> (TEI header) supplies descriptive and declarative metadata associated with a digital resource or set of resources.

<text> contains a single text of any kind, whether unitary or composite, for example a poem or drama, a collection of essays, a novel, a dictionary, or a corpus sample.

<facsimile> contains a representation of some written source in the form of a set of images rather than as transcribed or encoded text.

3 Encoding the Body

As indicated above, a unitary text is encoded by means of a <text> element, which may contain the following elements:

<front> (front matter) contains any prefatory matter (headers, abstracts, title page, prefaces, dedications, etc.) found at the start of a document, before the main body.

<group> contains the body of a composite text, grouping together a sequence of distinct texts (or groups of such texts) which are regarded as a unit for some purpose, for example the collected works of an author, a sequence of prose essays, etc.

<body> (text body) contains the whole body of a single unitary text, excluding any front or back matter.

<back> (back matter) contains any appendixes, etc. following the main part of a text.

Elements specific to front and back matter are described below in section 13. Front and Back Matter. In this section we discuss the elements making up the body of a text. A text must always have a body.

3.1 Text Division Elements and Global Attributes

The body of a prose text may be just a series of paragraphs or similar blocks of text, or these may be grouped together into chapters, sections, subsections, etc. The <div> element is used to represent any such grouping of blocks.

<div> (text division) contains a subdivision of the front, body, or back of a text.

@type [att.typed] characterizes the element in some sense, using any convenient classification scheme or typology.

The type attribute on the <div> element may be used to supply a conventional name for this category of text division in order to distinguish them. Typical values might be book, chapter, section, part, poem, song, etc. TEI simplePrint does not constrain the range of values that may be used here.

A <div> element may itself contain further, nested, <div>s, thus mimicking the traditional structure of a book, which can be decomposed hierarchically into units such as parts, containing chapters, containing sections, and so on. TEI texts in general conform to this simple hierarchic model.

Here as elsewhere the xml:id attribute may be used to supply a unique identifier for the division, which may be used for cross references or other links to it, such as a commentary, as further discussed in section 3.7. Cross References and Links. It is good practice to provide an xml:id attribute for every major structural unit in a text, and to derive its values in some
systematic way, for example by appending a section number to a short code for the title of the work in question, as in the examples below.

The \texttt{n} attribute may be used to supply (additionally or alternatively) a short mnemonic name or number for a division, or any other element. If a conventional form of reference or abbreviation for the parts of a work already exists (such as the book/chapter/verse pattern of Biblical citations), the \texttt{n} attribute is the place to record it; unlike the identifier supplied by the \texttt{xml:id} attribute, it does not need to be unique.

The \texttt{xml:lang} attribute may be used to specify the language of the division. Languages are identified by an internationally defined code, as further discussed in section 3.5.3. Foreign Words or Expressions below.

The \texttt{rendition} attribute may be used to supply information about the rendition (appearance) of a division, or any other element, as further discussed in section 3.5. Marking Highlighted Phrases below. Note that this attribute is used to describe the appearance of the source text, rather than the appearance of any intended output when the encoded text is displayed. The two may of course be similar, or identical, but the TEI does not assume or require this.

These four attributes, \texttt{xml:id}, \texttt{n}, \texttt{xml:lang}, and \texttt{rendition} are so widely useful that they are allowed on any element in any TEI schema: they are called \textit{global attributes}. Other attributes defined in the TEI simplePrint schema are discussed in section 3.7.3. Special Kinds of Linking.

As noted above, the value of every \texttt{xml:id} attribute must be unique within a document. One simple way of ensuring this is to make it reflect the hierarchic structure of the document. For example, Smith’s \textit{Wealth of Nations} as first published consists of five books, each of which is divided into chapters, while some chapters are further subdivided into parts. We might define \texttt{xml:id} values for this structure as follows:

```xml
<body>
  <div xml:id="WN1" n="I" type="book">
    <div xml:id="WN101" n="I.1" type="chapter">
      <!-- ... -->
    </div>
  </div>
  <div xml:id="WN102" n="I.2" type="chapter">
    <!-- ... -->
  </div>
  <div xml:id="WN110" n="I.10" type="chapter">
    <div xml:id="WN1101" n="I.10.1" type="part">
      <!-- ... -->
    </div>
    <div xml:id="WN1102" n="I.10.2" type="part">
      <!-- ... -->
    </div>
  </div>
  <div xml:id="WN2" n="II" type="book">
    <!-- ... -->
  </div>
</body>
```

A different numbering scheme may be used for \texttt{xml:id} and \texttt{n} attributes: this is often useful where a canonical reference scheme is used which does not tally with the structure of the work. For example, in a novel divided into books each containing chapters, where the chapters are numbered sequentially through the whole work, rather than within each book, one might use a scheme such as the following:
Here the work has two volumes, each containing two chapters. The chapters are numbered conventionally 1 to 4, but the xml:id values specified allow them to be regarded additionally as if they were numbered 1.1, 1.2, 2.1, 2.2.

3.2 Headings and Closings
Every <div> may have a title or heading at its start, and (less commonly) a trailer such as End of Chapter 1 at its end. The following elements may be used to transcribe them:

- <head> (heading) contains any type of heading, for example the title of a section, or the heading of a list, glossary, manuscript description, etc.
- <trailer> contains a closing title or footer appearing at the end of a division of a text.

Some other elements which may be found at the beginning or ending of text divisions are discussed below in section 13.1.2, Prefatory Matter.

Whether or not headings and trailers are included in a transcription is a matter for the individual transcriber to decide. Where a heading is completely regular (for example Chapter 1) or may be automatically constructed from attribute values (e.g. <div type="chapter" n="1"/>), it may be omitted; where it contains otherwise unrecoverable text it should always be included. For example, the start of Hardy’s Under the Greenwood Tree might be encoded as follows:

```
<div xml:id="UGT1" n="Winter" type="part">
  <div xml:id="UGT101" n="1" type="chapter">
    <head>Mellstock-Lane</head>
    <p>To dwellers in a wood almost every species of tree ...</p>
  </div>
</div>
```

3.3 Textual Components
In prose texts such as the Brontë example above, the divisions are generally composed of paragraphs, represented as <p> elements, though in some circumstances it may be preferred to use the anonymous block element <ab>. In poetic or dramatic texts different elements are used, representing stanzas and verse lines in the first case, and individual speeches or stage directions in the second:

- <p> (paragraph) marks paragraphs in prose.
- <ab> (anonymous block) contains any arbitrary component-level unit of text, acting as an anonymous container for phrase or inter level elements analogous to, but without the semantic baggage of, a paragraph.
3.3 Textual Components

<lg n="I"> (line group) contains one or more verse lines functioning as a formal unit, e.g. a stanza, refrain, verse paragraph, etc.

<sp> (speech) contains an individual speech in a performance text, or a passage presented as such in a prose or verse text.

<speaker> contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<stage> (stage direction) contains any kind of stage direction within a dramatic text or fragment.

We discuss each of these kinds of component separately below.

3.3.1 Verse

Here, for example, is the start of a poetic text in which verse lines and stanzas are tagged:

```
<lg n="I">
<l>I Sing the progresse of a deathlesse soule,</l>
<l>Whom Fate, with God made, but doth not controule,</l>
<l>... ... ...</l>
<l>A worke t'out weare Seths pillars, bricke and stone,</l>
<l>And (holy writs excepted) made to yeeld to none,</l>
</lg>
```

Note that the <l> element marks verse lines, not typographic lines: as elsewhere the original lineation of the source text is not therefore preserved by this encoding. The <lb> element described in section 3.4. Page and Line Numbers might additionally be used to mark typographic lines if so desired.

In a poetic text it may also be considered useful to identify the rhymes, for which the following element may be used:

<rhyme> marks the rhyming part of a metrical line.

@label provides a label (usually a single letter) to identify which part of a rhyme scheme this rhyming string instantiates.

The following example shows how this element might be used both to identify rhyming words or word parts and to assign each rhyme to a part of a rhyming pattern by means of its label attribute. The rhyming pattern here is specified by the rhyme attribute supplied on the <lg> representing the stanza within which the pattern operates:

```
<lg rhyme="AABCCBBA">
<l>The sunlight on the <rhyme label="A">garden</rhyme></l>
<l></l>
<l>That Harden</rhyme>s and grows <rhyme label="B">cold</rhyme>,</l>
<l>We cannot cage the <rhyme label="C">minute</rhyme></l>
<l></l>
<l>Wi</l>
<l>thin it</rhyme>s nets of <rhyme label="B">gold</rhyme></l>
<l>When all is <rhyme label="B">told</rhyme></l>
<l>We cannot beg for <rhyme label="A">pardon</rhyme>.</l>
</lg>
```

The rhyme attribute may be used independently of the <rhyme> element, or in combination with it, as above.
3 ENCODING THE BODY

3.3.2 Drama

A dramatic text contains speeches, which may be in prose or verse, and will also contain stage directions. The `<sp>` element is used to represent each identified speech. It contains an optional speaker indication, marked with the `<speaker>` element, which can be followed by one or more `<l>` or `<p>` elements, depending on whether the speech is considered to be in prose or in verse. Stage directions, whether within or between speeches, are marked using the `<stage>` element. For example:

```html
<sp>
  <speaker>Vladimir</speaker>
  <p>Pull on your trousers.</p>
</sp>

<sp>
  <speaker>Estragon</speaker>
  <p>You want me to pull off my trousers?</p>
</sp>

<sp>
  <speaker>Vladimir</speaker>
  <p>Pull <hi>on</hi> your trousers.</p>
</sp>

<sp>
  <speaker>Vladimir</speaker>
  <p>(realizing his trousers are down)</p>
</sp>

<stage>He pulls up his trousers</stage>

<sp>
  <speaker>Estragon</speaker>
  <p>Yes, let's go.</p>
</sp>

<stage>They do not move.</stage>
```

In a verse drama, it is quite common to find that verse lines are split between speakers. The easiest way of encoding this is to use the `part` attribute to indicate that the lines so fragmented are incomplete:

```html
<div type="Act" n="I">
  <head>ACT I</head>
  <div type="Scene" n="1">
    <head>SCENE I</head>
    <stage rendition="#italic">Enter Barnardo and Francisco, two Sentinels, at several doors</stage>
    <sp>
      <speaker>Barn</speaker>
      <l part="Y">Who's there?</l>
    </sp>
    <sp>
      <speaker>Francisco</speaker>
      <l>Nay, answer me. Stand and unfold yourself.</l>
    </sp>
    <sp>
      <speaker>Barn</speaker>
      <l part="I">Long live the King!</l>
    </sp>
  </div>
</div>
```
The value of the part attribute may indicate just that the element bearing is fragmented in some (unspecified) respect rather than a complete verse line (part="Y"); alternatively it may indicate whether this is an initial (I), medial (M) or F (final) fragment.

The same mechanism may be applied to stanzas which are divided between two speakers:

```
<sp>
  <speaker>First voice</speaker>
  <lg type="stanza" part="I">
    <l>But why drives on that ship so fast?</l>
    <l>Withouten wave or wind?</l>
  </lg>
</sp>
<sp>
  <speaker>Second Voice</speaker>
  <lg type="stanza" part="F">
    <l>The air is cut away before.</l>
    <l>And closes from behind.</l>
  </lg>
</sp>
```

The element can also be used for dialogue presented in a prose work as if it were drama, as in the next example, which also demonstrates the use of the who attribute to bear a code identifying the speaker of the piece of dialogue concerned:

```
<sp who="#OPI">
  <speaker>The reverend Doctor Opimian</speaker>
  <p>I do not think I have named a single unpresentable fish.</p>
</sp>
<sp who="#GRM">
  <speaker>Mr Gryll</speaker>
  <p>Bream, Doctor: there is not much to be said for bream.</p>
</sp>
<sp who="#OPI">
  <speaker>The Reverend Doctor Opimian</speaker>
  <p>On the contrary, sir, I think there is much to be said for him. In the first place....</p>
  <p>Fish, Miss Gryll -- I could discourse to you on fish by the hour: but for the present I will forbear.</p>
```
Here the *who* attribute values (#OPI etc.) are links, pointing to items in a list of the characters in the novel. In the case of a play, this list of characters might appear in the original source as a cast list or dramatic personae, which might be marked up using the `<castList>` element described in section 13.2.2. *Specialized Front and Back Matter* below. Such a list would not, of course, be appropriate to provide descriptive information about each character, much of which does not appear in the original source. Instead a `<particDesc>` (participant description) element should be provided in the TEI header, as further discussed in section 15.3. *The Profile Description* below.

### 3.3.3 Other Kinds of Text Block

As mentioned above, the `<ab>` element may also be used in preference to the `<p>` element. It should be used for blocks of text which are not clearly paragraphs, verse lines, or dramatic speeches. Typical examples include the canonical verses of the Bible, and the textual blocks of other ancient documents which predate the invention of the paragraph, such as Greek inscriptions or Egyptian hieroglyphs. The element is also useful as a means of encoding more specialized kinds of textual block, such as the question and answer structure of a catechism, or the highly formalized substructure of a legal document (if `<div>` is not considered appropriate for these). In more modern documents, it can be used to encode semi-organized or fragmentary materials such as an artist’s notebook or work in progress; or to faithfully capture the substructure of a file produced by an OCR system.

### 3.4 Page and Line Numbers

Page and line breaks etc. may be marked with the following elements:

- `<pb>` (page beginning) marks the beginning of a new page in a paginated document.
- `<lb>` (line beginning) marks the beginning of a new (typographic) line in some edition or version of a text.
- `<cb>` (column beginning) marks the beginning of a new column of a text on a multi-column page.
- `<milestone>` marks a boundary point separating any kind of section of a text, typically but not necessarily indicating a point at which some part of a standard reference system changes, where the change is not represented by a structural element.
- `<fw>` (forme work) contains a running head (e.g. a header, footer), catchword, or similar material appearing on the current page.

The `<pb>`, `<lb>`, and `<cb>` elements are special cases of a general class of elements known as *milestones* because they mark reference points within a text. The generic `<milestone>` element can mark any kind of reference point: for example, a column break, the start of a new kind of section not otherwise tagged, a change of author or style, or in general any significant change in the text not enclosed by an XML element. Unlike other elements, milestone elements do not enclose a piece of text and make an assertion about it; instead they indicate a point in the text where something changes, as indicated by a change in the values of the milestone’s attributes *unit*, which indicates the something concerned, and *n* which indicates the new value.

The `<pb>`, `<lb>`, and `<cb>` elements are shortcuts or *syntactic sugar* for `<milestone unit="page"/>` `<milestone unit="line"/>` and `<milestone unit="column"/>` respectively.

When working from a paginated original, it is often useful to record its pagination, whether to simplify later proof-reading, or to align the transcribed text with a set of page images, as further discussed below.
3.4 Page and Line Numbers

Because `<pb>` and other milestone elements are empty, they may be placed freely within or between other elements. However, it is recommended practice always to put them at the beginning of whatever unit it is that their presence implies, and not to nest them within elements contained by that unit. For example, in the following example a page break occurs between two lines of a poem:

```xml
<l>Mary had a little lamb</l>
<pb n="13"/>
<l>Its fleece was white as snow</l>
```

The `<pb>` element should be placed ahead of all the text encoded on the 13th page. Contrast this with the following less accurate encoding:

```xml
<l>Mary had a little lamb</l>
<l><pb n="13">Its fleece was white as snow</pb>
</l>
```

This is less accurate because it implies that the second verse line actually begins before the page break.

Similar considerations apply to line breaks (`<lb>`), though these are less frequently considered useful when encoding modern printed textual sources. When transcribing manuscripts or early printed books, however, it is often helpful to retain them in an encoding, if only to facilitate alignment of transcription and original. Like `<pb>`, the `<lb>` element should appear before the text of the line whose start it signals.

If features such as pagination or lineation are marked for more than one edition, the edition in question may be specified by the `ed` attribute. For example, in the following passage we indicate where the page breaks occur in two different editions (ED1 and ED2):

```xml
<p>I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and <pb ed="ED1" n="475">Mary approved the step unreservedly. Diana announced that she would <pb ed="ED2" n="485">just give me time to get over the honeymoon, and then she would come and see me.</p>
```

When transcribing from a paginated source, the encoder must decide whether to suppress such features as running titles, page signatures, catch words etc., to replace them by a simplified representation using the `<pb>` element, perhaps using the `n` attribute to preserve some of the information, or to preserve them entirely using the `<fw>` element. The latter strategy is appropriate in encodings which aim to retain as much information as possible about the original typography; it will however make more complex the processing of the source for other purposes, as in the following example:

```xml
<l>He also fix'd the wandering QUEEN OF NIGHT.</l>
<fw type="sig">Ii 2</fw>
<fw type="catch">Whether</fw>
<pb n="244"/>
<l>Whether she wanes into a scanty orb...</l>
<!-- Thomson, Seasons, 1730-->
```
The `<pb>` element is also used to align parts of a transcription with a digital image of the page concerned. This may be done in a very simple but inflexible way by using the `facs` attribute to point to each page image concerned:

```
<p>I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and <pb ed="ED1" n="475" facs="edip475.png"/> Mary approved the step unreservedly... </p>
```

The `facs` attribute can supply (as here) a filename, or any other form of URI, if for example the page image is stored remotely. One drawback of this simplistic approach is that there must be exactly one image file per page of text. It is not therefore suitable in the case where the available page images represent double page spreads, or where there are multiple images of the same page (for example at different resolutions).

A more powerful approach, discussed in section **14. Encoding a Digital Facsimile** below, is to use the `<facsimile>` element to define the organisation of the set of images representing the text, and then use the `facs` attribute to point to individual components of that representation.

### 3.5 Marking Highlighted Phrases

#### 3.5.1 Changes of Typeface, etc.

Highlighted words or phrases are those made visibly different from the rest of the text, typically by a change of type font, handwriting style, ink colour etc., which is intended to draw the reader’s attention to some associated change.

The global `rendition` attribute can be attached to any element, and used wherever necessary to specify details of the highlighting used for it in the source. For example, a heading rendered in bold might be tagged `<head rendition="simple:bold">`, and one in italic `<head rendition="simple:italic">`.

The values used for the `rendition` attribute point to definitions provided for the formatting concerned. These definitions are typically provided by a `<rendition>` element in the document’s header, as further discussed in section **15.2.3. Tagging Declaration**.

It is not always possible or desirable to interpret the reasons for such changes of rendering in a text. In such cases, the element `<hi>` may be used to mark a sequence of highlighted text without making any claim as to its status.

`<hi>` (highlighted) marks a word or phrase as graphically distinct from the surrounding text, for reasons concerning which no claim is made.

In the following example, the use of a distinct typeface for the subheading and for the included name are recorded but not interpreted:

```
<hi rendition="simple:blackletter">And this Indenture further witnesseth</hi> that the said <hi rendition="simple:italic">Walter Shandy</hi>, merchant, in consideration of the said intended marriage ...
```

Alternatively, where the cause for the highlighting can be identified with confidence, a number of other, more specific, elements are available.

`<foreign>` identifies a word or phrase as belonging to some language other than that of the surrounding text.

`<label>` contains any label or heading used to identify part of a text, typically but not exclusively in a list or glossary.

`<title>` contains a title for any kind of work.
Some features (notably quotations, titles, and foreign words) may be found in a text either marked by highlighting, or with quotation marks. In either case, the element <q> (as discussed in the following section) should be used. Again, the global rendition attribute can be used to record details of the highlighting used in the source if this is thought useful.

As an example of the elements defined here, consider the following sentence: On the one hand the *Nibelungenlied* is associated with the new rise of romance of twelfth-century France, the *romans d’antiquité*, the romances of Chrétien de Troyes, and the German adaptations of these works by Heinrich van Veldeke, Hartmann von Aue, and Wolfram von Eschenbach. Interpreting the role of the highlighting, the sentence might be encoded as follows:

```
<p>On the one hand the <title>Nibelungenlied</title> is associated with the new rise of romance of twelfth-century France, the <foreign>romans d’antiquité</foreign>, the romances of Chrétien de Troyes, ...</p>
```

Describing only the appearance of the original, it might be encoded like this:

```
<p>On the one hand the <hi rendition="simple:italic">Nibelungenlied</hi> is associated with the new rise of romance of twelfth-century France, the <hi rendition="simple:italic">romans d’antiquité</hi>, the romances of Chrétien de Troyes, ...</p>
```

### 3.5.2 Quotations and Related Features

Like changes of typeface, quotation marks are conventionally used to denote several different features within a text, of which the most frequent is quotation, though many other features are possible. The full TEI Guidelines provide additional elements such as <mentioned> or <said> to distinguish some of these features, but these more specialised elements are not included in TEI simplePrint. In TEI Simple however, we use the <quote> element for quotation only, and the <q> element for all other material found within quotation marks in the text.

<q> (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

<quote> (quotation) contains a phrase or passage attributed by the narrator or author to some agency external to the text.

Here is a simple example of a quotation:

```
<p>Few dictionary makers are likely to forget Dr. Johnson’s description of the lexicographer as <quote>a harmless drudge.</quote></p>
```

As elsewhere, the way that a citation or quotation was printed (for example, *in-line* or set off as a *display* or *block quotation*), may be represented using the rendition attribute. This may also be used to indicate the kind of quotation marks used.

Direct speech interrupted by a narrator can be represented simply by ending the <q> element and beginning it again after the interruption, as in the following example:
Who-debel you?” he at last said — you no speak-e, damme, I kill-e. And so saying, the lighted tomahawk began flourishing about me in the dark.

If it is important to convey the idea that the two elements together make up a single speech, the linking attributes next and prev may be used, as described in section 3.7.3. Special Kinds of Linking.

Direct speech may be accompanied by a reference to the source or speaker, using the who attribute, whether or not this is explicit in the text, as in the following example:

Spaulding, he came down into the office just this day eight weeks with this very paper in his hand, and he says:—I wish to the Lord, Mr. Wilson, that I was a red-headed man.

This example also demonstrates how quotations may be embedded within other quotations: one speaker (Wilson) quotes another speaker (Spaulding).

The creator of the electronic text must decide whether quotation marks are replaced by the tags or whether the tags are added and the quotation marks kept. If the quotation marks are removed from the text, the rendition attribute may be used to record the way in which they were rendered in the copy text.

3.5.3 Foreign Words or Expressions

Words, phrases, or longer stretches of text that are not in the main language of the texts may be tagged as such in one of two ways. The global xml:lang attribute may be attached to any element to show that it uses some other language than that of the surrounding text. Where there is no applicable element, the element <foreign> may be used, again using the xml:lang attribute. For example:

John has real savoir-faire.

Have you read Die Dreigroschenoper?

As these examples show, the <foreign> element should not be used to tag foreign words if some other more specific element such as <title>, or <div> applies.

The value of the xml:lang attribute on an element applies hierarchically to everything contained by that element, unless overridden:

Pars haec Latine composita est.

Except that this sentence is in English.

Vita brevis, ars longa.

Here we specify that the whole element uses the language with the coded identifier la i.e., Latin. Since it is contained by that element there is no need to supply this information again for the first <s> element. The second <s> element however overrides this value, and indicates that its content is in English (the language with identifier en). The third <s> element is again in Latin.
The codes used to identify languages, supplied on the xml:lang attribute, are defined by an international standard\(^3\), as further explained in the relevant section of the TEI Guidelines. Some simple example codes for a few languages are given here:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>zh</td>
<td>Chinese</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
<tr>
<td>enm</td>
<td>Middle English</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>grc</td>
<td>Ancient Greek</td>
</tr>
<tr>
<td>ja</td>
<td>Japanese</td>
</tr>
<tr>
<td>la</td>
<td>Latin</td>
</tr>
<tr>
<td>sa</td>
<td>Sanskrit</td>
</tr>
</tbody>
</table>

### 3.6 Notes

A note is any additional comment found in a text, marked in some way as being out of the main textual stream. A note is always attached to some part of the text, implicitly or explicitly: we call this its target, or its point of attachment. The element `<note>` should be used to mark any kind of note whether it appears as a separate block of text in the main text area, at the foot of the page, at the end of the chapter or volume, in the margin, or in some other place.

`<note>` contains a note or annotation.

Notes may be in a different hand or typeface, may be authorial or editorial, and may have been added later. The attributes `type` and `resp` can be used to distinguish between different kinds of notes or identify their authors.

In a printed or written text, the point of attachment for a note is typically represented by a siglum such as an alphanumerical or other character, often in superscripted form. When encoding such a text, it is conventional to replace this siglum by a note element containing the annotation itself, as in the following example:

```
<p>...some text <note xml:id="n7">a note about some text</note> .... </p>
```

An alternative approach is to encode the point of attachment wherever it appears in the text, using for example the `<ref>` element discussed in the next section, and to place the `<note>` element anywhere convenient. The two can then be associated by using the `target` attribute on the `<ref>` element to point to the `<note>` element, as in the following example, in which the superscripted 7 indicating the point of attachment has been retained as part of the encoding:

```
<p>...some text <ref target="#n7" rendition="simple:superscript">7</ref> .... <note xml:id="n7">a note about some text</note>
</p>
```

It may however be problematic to determine the precise position of the point of attachment, particularly in the case of marginal notes. A marginal note may also be hard to distinguish from a label or subheading which introduces the text with which it is associated. Where the purpose of the note is clearly to label the associated text, rather than to comment on it, the element `<label>` may be preferable. Where it is clearly a subheading attached to a distinct subdivision, it may be preferable to start a new element `<div>` and encode the subheading as a `<head>`.

---

Note however that a `<head>` cannot be inserted anywhere except at the beginning of a `<div>`. And where (as in some Early Modern English plays) marginal annotation is systematically used to identify speakers, it may be better to represent these using the `<speaker>` element introduced above. In cases of doubt, the encoder should decide on a clear policy and preferably document it for the use of others.

3.7 Cross References and Links

Any kind of cross reference or link found at one point in a text which points to another part of the same or another document may be encoded using the `<ref>` element discussed in this section. Implicit links (such as the association between two parallel texts, or that between a text and its interpretation) may be encoded using the linking attributes discussed in section 3.7.3. Special Kinds of Linking.

3.7.1 Simple Cross References

`<ref>` (reference) defines a reference to another location, possibly modified by additional text or comment.

Usually, the presence of a cross-reference or link will be indicated by some text or symbol in the source being encoded, which will then become the content of the `<ref>` element. Occasionally, however, and frequently in the case of a born digital document, the exact form and appearance of the cross reference text will be determined dynamically by the software processing the document. In such cases, the `<ref>` element will have no content, and serve simply to mark a point from which a link is to be made, along with the target of the link.

The following two forms, for example, are logically equivalent:

See especially `<ref target="#SEC12">section 12 on page 34</ref>`.

See especially `<ref target="#SEC12"/>`.

In both cases, there is a cross reference from the position in the source document immediately following the word `especially` to whatever element in the encoded document has the identifier SEC12. In the first case, the encoder has supplied the original form of the cross reference section 12 on page 34; in the second, the task of generating an appropriate form of cross reference has been left to the formatting software. Perhaps the pagination and section numbers of the document in question are not yet determined; perhaps the cross reference should be replaced by a big red button. In either case, however, the value of the `target` attribute must be the identifier of some other element within the current document. Since the passage or phrase being pointed at must bear an identifier, it must be an element of some kind. In the following example, the cross reference is to a `<div>` element:

```xml
... see especially `<ref target="#SEC12"/>`.
...
<div xml:id="SEC12">
  <head>Concerning Identifiers</head>
</div>... -->
</div>
```

Because the `xml:id` attribute is global, any element in a TEI document may be pointed to in this way. In the following example, a paragraph has been given an identifier so that it may be pointed at:
3.7 Cross References and Links

Sometimes the target of a cross reference does not correspond with any particular feature of a text, and so may not be tagged as an element of some kind. If the desired target is simply a point in the current document, the easiest way to mark it is by introducing a `<anchor>` element at the appropriate spot. If the target is some sequence of words not otherwise tagged, the `<seg>` element may be used to mark them. These two elements are described as follows:

- `<anchor>` (anchor point) attaches an identifier to a point within a text, whether or not it corresponds with a textual element.
- `<seg>` (arbitrary segment) represents any segmentation of text below the chunk level.

In the following example, `<ref>` elements have been used to represent points in this text which are to be linked in some way to other parts of it; in the first case to a point, and in the second, to a sequence of words:

Returning to `<ref target="#ABCD">the point where I dozed off</ref>`, I noticed that `<ref target="#EFGH">three words</ref>` had been circled in red by a previous reader.

This encoding requires that elements with the specified identifiers (ABCD and EFGH in this example) are to be found somewhere else in the current document. Assuming that no element already exists to carry these identifiers, the `<anchor>` and `<seg>` elements may be used:

The `type` attribute should be used (as above) to distinguish amongst different purposes for which these general purpose elements might be used in a text. Some other uses are discussed in section 3.7.3. Special Kinds of Linking below.

3.7.2 Pointing to other documents

So far, we have shown how the `<ref>` element may be used for cross-references or links whose targets occur within the same document as their source. The element may also be used to refer to elements in any other XML document or resource, such as a document on the web, or a database component. This is possible because the value of the `target` attribute may be any valid Uniform Resource Identifier (URI).

A URI may reference a web page or just a part of one, for example `http://www.tei-c.org/index.xml#SEC2`. The hash sign indicates that what follows it is the identifier of an element to be located within the XML document identified by what precedes it: this example will therefore locate an element which has an `xml:id` attribute value of SEC2 within the document retrieved from `http://www.tei-c.org/index.xml`. In the examples we have discussed so far, the part to the left of the sharp sign has been omitted: this is understood to mean that the referenced element is to be located within the current document.

It is also possible to define an abbreviated form of the URI, using a predefined prefix separated from the rest of the code by a colon, as for example `cesr:SEC2`. This is known as a private URI.

---

4A full definition of this term, defined by the W3C (the consortium which manages the development and maintenance of the World Wide Web), is beyond the scope of this tutorial: however, the most frequently encountered version of a URI is the familiar URL used to indicate a web page, such as `http://www.tei-c.org/index.xml`
since the prefix is not standardized (except that the prefix xml: is reserved for use by XML itself). A <prefixDef> element should be supplied within the TEI header specifying how the prefix (here cesr) should be translated to give a full URL for the link. This is particularly useful if a document contains many references to an external document such as an authority file.

Parts of an XML document can be specified by means of other more sophisticated mechanisms using a language called Xpointer, also defined by the W3C. This is useful when, for example, the elements to be linked to do not bear identifiers. Further information about this and other forms of link addressing is provided in chapter 16 of the TEI Guidelines but is beyond the scope of the present document.

3.7.3 Special Kinds of Linking

The following special purpose linking attributes are defined for every element in the TEI simplePrint schema:

ana links an element with its interpretation.

corresp links an element with one or more other corresponding elements.

next links an element to the next element in an aggregate.

prev links an element to the previous element in an aggregate.

The ana (analysis) attribute is intended for use where a set of abstract analyses or interpretations have been defined somewhere within a document, as further discussed in section 10. Analysis. For example, a linguistic analysis of the sentence John loves Nancy might be encoded as follows:

```xml
<seg type="sentence" ana="#SVO">
  <seg type="lex" ana="#NP1">John</seg>
  <seg type="lex" ana="#VVI">loves</seg>
  <seg type="lex" ana="#NP1">Nancy</seg>
</seg>
```

This encoding implies the existence elsewhere in the document of elements with identifiers SVO, NP1, and VV1 where the significance of these particular codes is explained. Note the use of the <seg> element to mark particular components of the analysis, distinguished by the type attribute.

The corresp (corresponding) attribute provides a simple way of representing some form of correspondence between two elements in a text. For example, in a multilingual text, it may be used to link translation equivalents, as in the following example:

```xml
<seg xml:lang="fr" xml:id="FR1" corresp="#EN1">Jean aime Nancy</seg>
<seg xml:lang="en" xml:id="EN1" corresp="#FR1">John loves Nancy</seg>
```

The same mechanism may be used for a variety of purposes. In the following example, it has been used to represent the correspondences between the show and Shirley, and between NBC and the network:

```xml
<p>
  <title xml:id="shirley">Shirley</title>,
  which made its Friday night debut only a month ago, was not listed on
</p>
```
The next and prev attributes provide a simple way of linking together the components of a discontinuous element, as in the following example:

<q xml:id="Q1a" next="#Q1b">Who-e debel you?</q> — he at last said — <q xml:id="Q1b" prev="#Q1a">you no speak-e, damme, I kill-e.</q> And so saying, the lighted tomahawk began flourishing about me in the dark.

4 Editorial Interventions

The process of encoding an electronic text has much in common with the process of editing a manuscript or other text for printed publication. In either case a conscientious editor may wish to record both the original state of the source and any editorial correction or other change made in it. The elements discussed in this and the next section provide some facilities for meeting these needs.

4.1 Correction and Normalization

The following elements may be used to mark corrections, that is editorial changes introduced where the editor believes the original to be erroneous:

<corr> (correction) contains the correct form of a passage apparently erroneous in the copy text.

<sic> (Latin for thus or so) contains text reproduced although apparently incorrect or inaccurate.

The following elements may be used to mark normalization, that is editorial changes introduced for the sake of consistency or modernization of a text:

.orig> (original form) contains a reading which is marked as following the original, rather than being normalized or corrected.

<reg> (regularization) contains a reading which has been regularized or normalized in some sense.

Consider, for example, the following famous passage as it appears in the first quarto printing of Shakespeare’s Henry V: in particular the phrase we might transcribe directly as

Figure 1: Detail from Henry V, first quarto (1600)
... for his Nose was as sharpe as a Pen, and a Table of greene fields

A modern editor might wish to make a number of interventions here, specifically to modernize (or normalize) the Elizabethan spellings of a’ and sharpe for he and sharp respectively. They might also want to emend table to babbl’d, following an editorial tradition that goes back to the 18th century Shakespearian scholar Lewis Theobald. The following encoding would then be appropriate:

... for his Nose was as <reg>sharp</reg> as a Pen and
<reg>he</reg>
<corr resp="#Theobald">babbl'd</corr> of green fields

A more conservative or source-oriented editor, however, might want to retain the original, but at the same time signal that some of the readings it contains are in some sense anomalous:

... for his Nose was as <orig>sharpe</orig> as a Pen, and
<orig>a</orig>
<sic>Table</sic> of green fields

Finally, a modern digital editor may decide to combine both possibilities in a single composite text, using the <choice> element. 
<choice> groups a number of alternative encodings for the same point in a text. This allows an editor to indicate where alternative encodings are possible:

... for his Nose was as <choice>
<orig>sharpe</orig>
<reg>sharp</reg>
</choice> as a Pen, and
<choice>
<orig>a</orig>
<reg>he</reg>
</choice>
<choice>
<corr resp="#Theobald">babbl'd</corr>
<sic>Table</sic>
</choice> of green fields

4.2 Omissions, Deletions, and Additions

In addition to correcting or normalizing words and phrases, editors and transcribers may also supply missing material, omit material, or transcribe material deleted or crossed out in the source. In addition, some material may be particularly hard to transcribe because it is hard to make out on the page. The following elements may be used to record such phenomena:

<add> (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector.
<gap> indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible.
<del> (deletion) contains a letter, word, or passage deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, or a previous annotator or corrector.
4.2 Omissions, Deletions, and Additions

contains a word, phrase, or passage which cannot be transcribed with certainty because it is illegible or inaudible in the source.

signifies text supplied by the transcriber or editor for any reason; for example because the original cannot be read due to physical damage, or because of an obvious omission by the author or scribe.

(substitution) groups one or more deletions (or surplus text) with one or more additions when the combination is to be regarded as a single intervention in the text. These elements may be used to record changes made by an editor, by the transcriber, or (in manuscript material) by the author or scribe. For example, if the source for an electronic text read The following elements are provided for simple editorial interventions. then it might be felt desirable to correct the obvious error, but at the same time to record the deletion of the superfluous second for, thus:

The following elements are provided for simple editorial interventions.

The attribute value #LB on the resp attribute is used to point to a fuller definition (typically in a element) of the person or other agency responsible for correcting the duplication of for.

If the source read The following elements provided for simple editorial interventions. (i.e. if the word are had been inadvertently dropped) then the scholar identified as LB might choose to encode the corrected text as follows:

The following elements are provided for simple editorial interventions.

These elements may also be used to record the actual writing process, for example to record passages which have been deleted, added, corrected etc., whether by the author of a literary text or by a scribe copying out a manuscript. An analysis of such documentary modifications may be essential before a reading text can be presented, and is clearly of importance in the editorial process.

The example is taken from the surviving authorial manuscript of a poem by the English writer Wilfred Owen, a part of which is shown here:

Figure 2: Detail from Dulce et decorum est autograph manuscript in the English Faculty Library, Oxford University.

Owen first wrote Helping the worst amongst us, but then deleted it, adding Dragging the worst amongst us over the top. In the same way, he revised the phrase half-blind by deleting the half- and adding all above it. In the last line, he started a word beginning fif before deleting it and writing the word five–nines. We can encode all of this as follows:
And towards our distant rest began to trudge,

Helping the worst amongst us

Dragging the worst amongst us,

who’d no boots

But limped on, blood–shod. All went lame;

half–all blind;

Drunk with fatigue; deaf even to the hoots

Of tired, outstripped five–nines that dropped behind.

The tags <add> and <del> elements are used to enclose passages added or deleted respectively. Additional attributes are available such as resp to indicate responsibility for the modification, or place to indicate where in the text (for example, above or below the line) the modification has been made. Where the encoder wishes to assert that the addition and deletion make up a single editorial act of substitution, these elements can be combined within a <subst> element as shown above.

A very careful examination of Owen’s second modification shows that he really did write amongt rather than amongst, presumably in error. An equally careful editor wishing to restore the missing s might use the <supplied> element to indicate that they have done so:

Dragging the worst among<s supplied resp="#ED">s</s> us</add>

Here the resp attribute has been used to indicate that the s was not supplied by Owen but by someone else, specifically the person documented elsewhere by an element with the identifier ED.

The <unclear> element is useful where material in the source is so hard to read that the transcriber is uncertain as to whether they have done so correctly. The <gap> element by contrast should be used where the material is so illegible that the transcriber does not wish even to attempt it. The two may however be used together as in the following example:

One hundred & twenty good regulars joined <unclear> to me <gap extent="2 words" reason="indecipherable"/> and </unclear> instantly, would aid me signally in an enterprise against Wilmington.

The <del> element marks material which is deleted in a source, but has been transcribed as part of the electronic text all the same, while <gap> marks the location of source material which is omitted from the electronic text, whether it is legible or not. A language corpus, for example, might omit long quotations in foreign languages. An extent attribute is available on the <gap> element to indicate how much material has been omitted. The <desc> element can be used inside the <gap> element to provide a brief characterisation of the omitted material, as in the following examples:

... An example of a list appearing in a fief ledger of <name type="place">Koldinghus</name> is given below. It shows cash income from a sale of honey.
<gap extent="50 lines"> Quotation from ledger (in Danish) </gap>
4.3 Abbreviation and their Expansion

At the bottom of your screen below the mode line is the `<hi>minibuffer</hi>`. This is the area where Emacs echoes the commands you enter and where you specify filenames for Emacs to find, values for search and replace, and so on. `<gap reason="graphic">`<gap reason="graphic">`<desc>diagram of Emacs screen</desc>`<gap reason="graphic">`</gap>

4.3 Abbreviation and their Expansion

Like names, dates, and numbers, abbreviations may be transcribed as they stand or expanded; they may be left unmarked, or encoded using the following elements:

- `<abbr>` (abbreviation) contains an abbreviation of any sort.
- `<expan>` (expansion) contains the expansion of an abbreviation.

The `<abbr>` element is useful as a means of distinguishing semi-lexical items such as acronyms or jargon:

Every manufacturer of `<abbr>3GL</abbr>` or `<abbr>4GL</abbr>` languages is currently nailing on `<abbr>0OP</abbr>` extensions

The `type` attribute may be used to distinguish types of abbreviation by their function.

The `<expan>` element is used to mark an expansion supplied by an encoder. This element is particularly useful in the transcription of manuscript materials. For example, the character `p` with a bar through its descender as a conventional representation for the word `per` is commonly encountered in Medieval European manuscripts. An encoder may choose to expand this as follows:

`<expan>per</expan>`

To record both an abbreviation and its expansion, the `<choice>` element mentioned above may be used to group the abbreviated form with its proposed expansion:

`<choice>
<abbr>wt</abbr>
<expan>with</expan>
</choice>`

The elements `<expan>` and `<abbr>` should contain a full word, or the abbreviated form of a full word respectively. For a fuller discussion of abbreviations and the intricacies of representing them consult the section on Abbreviation and Expansion in the TEI Guidelines.
5 Names, Codes, and Numbers

The TEI scheme defines elements for a large number of data-like features which may appear almost anywhere within almost any kind of text. These features may be of particular interest in a range of disciplines; they all relate to objects external to the text itself, such as the names of persons and places, strings of code, formulae, or numbers and dates. These items may also pose particular problems for natural language processing (NLP) applications. The elements described here, by making such features explicit, reduce the complexity of processing texts containing them.

5.1 Names and Referring Strings

A referring string is any phrase which refers to some person, place, object, etc. A name is a referring string which contains proper nouns and honorifics only. Two elements are provided to mark such strings:

- `<rs>` (referencing string) contains a general purpose name or referring string.
- `<name>` (name, proper noun) contains a proper noun or noun phrase.

The type attribute is used to distinguish amongst (for example) names of persons, places and organizations, where this is possible:

```
<q>My dear <name type="person">Mr. Bennet</name>, </q> said his lady to him one day,
<q>have you heard that <name type="place">Netherfield Park</name> is let at last?</q>
```

It being one of the principles of the
<name type="org">Circumlocution Office</name> never, on any account
whatsoever, to give a straightforward answer, <name type="person">Mr Barnacle</name>
said,
<q>Possibly.</q>

As the following example shows, the `<rs>` element may be used for a reference to a person, place, etc., which does not contain a proper noun or noun phrase:

```
<q>My dear <name type="person">Mr. Bennet</name>, </q> said <rs type="person">his lady</rs> to him one day...
```

Simply tagging something as a name is rarely enough to enable automatic processing of personal names into the canonical forms usually required for reference purposes. The name as it appears in the text may be inconsistently spelled, partial, or vague. Moreover, name prefixes such as van or de la, may or may not be included as part of the reference form of a name, depending on the language and country of origin of the bearer.

The ref attribute provides a way of linking a name with a description of the object being named, and may thus act as a normalized identifier for it. It is also very useful as a means of gathering together all references to the same individual or location scattered throughout a document:

```
<q>My dear <name type="person" ref="#BENM1">Mr. Bennet</name>, </q> said <rs type="person" ref="#BENM2">his lady</rs> to him one day,
<q>have you heard that <name type="place" ref="#NETP1">Netherfield Park</name> is let at last?</q>
```
The values used for the `ref` attribute here (#BENM1 etc.) are pointers; in this case indicating an element with the identifier BENM1 etc. somewhere in the current document, though any form of URI could be used. The element indicated will typically (for a person) be a `<person>` element, listed within a `<particDesc>` element, or (for a place) a `<place>` element, listed within a `<settingDesc>` element in the TEI header, as further discussed in 15.3. The Profile Description below.

This use should be distinguished from the case of the `<reg>` (regularization) element, which provides a means of marking the standard form of a referencing string as demonstrated below:

```xml
<name type="person" ref="#WADLM1">
  <choice>
    <orig>Walter de la Mare</orig>
    <reg>de la Mare, Walter</reg>
  </choice>
</name> was born at <name ref="https://en.wikipedia.org/wiki/Charlton,_London" type="place">Charlton</name>, in <name type="place">Kent</name>, in 1873.
```

### 5.2 Formulae, Codes, and Special Characters

The following elements may be useful when marking up sequences of text that represent mathematical expressions, chemical formulae, and the like:

- `<formula>` contains a mathematical or other formula.
- `<g>` (character or glyph) represents a glyph, or a non-standard character.

In many cases, a simple Unicode character suffices to represent the superscript or subscript digits and other symbols which may appear inside a mathematical formula:

```xml
<formula>E=mc²</formula>
```

In other more complex cases, the encoder may choose to use a different XML scheme (such as MathML) to encode the content of a formula, or a non-XML notation. These possibilities are not discussed further here.

The `<g>` element is useful in the case that no Unicode character exists to represent the character or glyph required. Its `ref` attribute can be used to point to a definition of the symbol intended, while its content (if any) represents a Unicode approximation to it:

```xml
...Thereto
<g ref="#air">[air]</g> and ...
```

The TEI header provides a number of additional elements for the definition of such non-Unicode characters, as further discussed in section 15.2.5. The character declaration below.

The following elements are useful for stretches of code or similar formal language appearing within a text:

- `<code>` contains literal code from some formal language such as a programming language.
- `<email>` (electronic mail address) contains an email address identifying a location to which email messages can be delivered.

This can be expressed in XML as follows:

```xml
<code>&lt;date notBefore="2016-06-23"/&gt;</code> Contact the author at
<email>lou.burnard@gmail.com</email>
```
Note in this example that characters which have a syntactic function in XML (such as the ampersand or the angle bracket) must be represented within a TEI simplePrint document by means of an entity reference such as &lt; or &amp;.

The element <ref> discussed in section 3.7, Cross References and Links should be used to represent a coded reference such as a link given as a URL within a text, either as content or as an attribute value:

```xml
<p>Further discussion of <ref target="http://www.tei-c.org/">the Text Encoding Initiative website</ref> may be found at <ref>http://www.tei-c.org/</ref></p>
```

### 5.3 Dates and Times

The following elements are provided for the detailed encoding of times and dates:

- `<date>` contains a date in any format.
- `<time>` contains a phrase defining a time of day in any format.

These elements have a number of attributes which can be used to provide normalized versions of their values in various ways.

**att.datable** provides attributes for normalization of elements that contain dates, times, or datable events.

- `@period` supplies a pointer to some location defining a named period of time within which the datable item is understood to have occurred.
- `@when [att.datable.w3c]` supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.
- `@notBefore [att.datable.w3c]` specifies the earliest possible date for the event in standard form, e.g. yyyy-mm-dd.
- `@notAfter [att.datable.w3c]` specifies the latest possible date for the event in standard form, e.g. yyyy-mm-dd.

The `when` attribute specifies a normalized form for the date or time, using one of the standard formats defined by ISO 8601. Partial dates or times (e.g. 1990, September 1990, twelvish) can be expressed by omitting a part of the value supplied, as in the following examples:

```xml
<date when="1980-02-21">21 Feb 1980</date>
<date when="1990">1990</date>
<date when="1990-09">September 1990</date>
<date when="--09">September</date>
<date when="2001-09-11T12:48:00">Sept 11th, 12 minutes before 9 am</date>
```

These attributes are typically used to make a date or time more easily processable, as in the following examples:

```xml
Given on the
<date when="1977-06-12">Twelfth Day of June in the Year of Our Lord One Thousand Nine Hundred and Seventy-seven of the Republic the Two Hundredth and first and of the University the Eighty-Sixth.</date>
```
specially when it's nine below zero
and three o'clock in the afternoon

They are also useful in cases where the date concerned is uncertain or only vaguely specified:

... during the second empire

in the weeks shortly before my birth

5.4 Numbers and Measurements

Like dates, both numbers and quantities can be written with either letters or digits and may therefore need to be normalized for ease of processing. Their presentation is also highly language-dependent (e.g. English 5th becomes Greek 5; English 123,456.78 equals French 123.456,78).

The following elements are provided for the detailed encoding of numbers and quantities:

- `<num>` (number) contains a number, written in any form.
  - `@type` indicates the type of numeric value.
  - `@value` supplies the value of the number in standard form.

- `<measure>` contains a word or phrase referring to some quantity of an object or commodity, usually comprising a number, a unit, and a commodity name.
  - `@quantity [att.measurement]` specifies the number of the specified units that comprise the measurement.
  - `@unit [att.measurement]` indicates the units used for the measurement, usually using the standard symbol for the desired units.
  - `@commodity [att.measurement]` indicates the substance that is being measured.

For example:

```
<num value="33">xxxiii</num>
<num type="cardinal" value="21">twenty-one</num>
<num type="percentage" value="10">ten percent</num>
<num type="percentage" value="10">10%</num>
<num type="ordinal" value="5">5th</num>
```

```
<measure quantity="40" unit="hogshead"
commodity="rum">2 score hh rum</measure>
<measure quantity="1" unit="dozen"
commodity="blooms">1 doz. roses</measure>
<measure quantity="1" unit="count"
commodity="blooms">a yellow tulip</measure>
```

6 Lists

The element `<list>` is used to mark any kind of list. A list is a sequence of text items, which may be numbered, bulleted, or arranged as a glossary list. Each item may be preceded by an item label (in a glossary list, this label is the term being defined):
<list> contains any sequence of items organized as a list.
<item> contains one component of a list.
<label> contains any label or heading used to identify part of a text, typically but not
exclusively in a list or glossary.

Individual list items are tagged with <item>. The first <item> may optionally be preceded
by a <head>, which gives a heading for the list. The numbering of items within the list may
be omitted, indicated using the n attribute on each item, or (rarely) tagged as content using
the <label> element. The following are all thus equivalent:

```xml
<list>
  <head>A short list</head>
  <item>First item in list.</item>
  <item>Second item in list.</item>
  <item>Third item in list.</item>
</list>
```

The styles should not be mixed in the same list.

A simple two-column table may be treated as a glossary list, tagged <list type="gloss">.
Here, each item comprises a term and a gloss, marked with <label> and <item> respectively.

```xml
<list type="gloss">
  <head>Vocabulary</head>
  <label xml:lang="enm">nu</label>
  <item>now</item>
  <label xml:lang="enm">lhude</label>
  <item>loudly</item>
  <label xml:lang="enm">bloweth</label>
  <item>blooms</item>
  <label xml:lang="enm">med</label>
  <item>meadow</item>
  <label xml:lang="enm">wude</label>
  <item>wood</item>
  <label xml:lang="enm">awe</label>
  <item>ewe</item>
  <label xml:lang="enm">lhouth</label>
  <item>lows</item>
  <label xml:lang="enm">sterteth</label>
  <item>bounds, frisks</item>
  <label xml:lang="enm">verteth</label>
  <item xml:lang="la">pedit</item>
  <label xml:lang="enm">murie</label>
  <item>merrily</item>
  <label xml:lang="enm">swik</label>
</list>
```
Where the internal structure of a list item is more complex, it may be preferable to regard the list as a table, for which special-purpose tagging is defined in section 8. Tables.

Lists of whatever kind can, of course, nest within list items to any depth required. Here, for example, a glossary list contains two items, each of which is itself a simple list:

Lists of bibliographic items should be tagged using the `<listBibl>` element, described in the next section.

## 7 Bibliographic Citations

It is often useful to distinguish bibliographic citations where they occur within texts being transcribed for research, if only so that they will be properly formatted when the text is printed out. The element `<bibl>` is provided for this purpose. Where the components of a bibliographic reference are to be distinguished, the following elements may be used as appropriate. It is generally useful to distinguish at least those parts (such as the titles of articles, books, and journals) which will need special formatting. The other elements are provided for cases where particular interest attaches to such details:

- `<bibl>` (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.
- `<author>` in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority.
- `<biblScope>` (scope of bibliographic reference) defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.
- `<date>` contains a date in any format.
7 BIBLIOGRAPHIC CITATIONS

<editor> contains a secondary statement of responsibility for a bibliographic item, for example the name of an individual, institution or organization, (or of several such) acting as editor, compiler, translator, etc.

<publisher> provides the name of the organization responsible for the publication or distribution of a bibliographic item.

<pubPlace> (publication place) contains the name of the place where a bibliographic item was published.

<relatedItem> contains or references some other bibliographic item which is related to the present one in some specified manner, for example as a constituent or alternative version of it.

<title> contains a title for any kind of work.

Consider, for example the following editorial note:

He was a member of Parliament for Warwickshire in 1445, and died March 14, 1470 (according to Kittredge, Harvard Studies 5. 88ff).

This might be encoded as follows:

He was a member of Parliament for Warwickshire in 1445, and died March 14, 1470 (according to <bibl><author>Kittredge</author>, <title>Harvard Studies</title> 5. 88ff</bibl>).

The bibliographic elements listed above are particularly useful in a born digital document which contains a bibliography encoded using the <listBibl> element. Entries in the bibliography should be given an identifier, which can then be used as the target of cross references from elsewhere in the document:

<p>Perec citing, amongst others <ref target="#MK_73">Sturm und Drang, 1973</ref>, concludes ... </p>

A <bibl> element may contain simply text, with possibly a few of its components distinguished by tagging, and much use of conventionalized punctuation, as in this example:

Alternatively, each of the components of the bibliographic reference may be clearly distinguished by tagging; in this case there is no requirement for conventionalized punctuation, since the processor will be able to generate this appropriately:

<bibl xml:id="MK73">
<author>Sturm, U.</author>
<author>Drang, F.</author>
<title xml:lang="de" level="m">Musikalische Katastrophe</title>
<pubPlace>Berlin</pubPlace>
<publisher>W. de Gruyter</publisher>
<date>1973</date>
</bibl>

The element <biblFull> is also provided for convenience in cases where bibliographic citations following a more sophisticated model have been used; it is permitted only in the TEI header.
8 Tables

The following elements are provided for the description of tabular matter, commonly found in many kinds of narrative text. Note that TEI simplePrint provides no sophisticated ways of describing the detailed layout of a table beyond its organization into rows and columns.

- `<table>` contains text displayed in tabular form, in rows and columns.
- `<row>` contains one row of a table.
- `<cell>` contains one cell of a table.

The `role` attribute may be used on either `<cell>` or `<row>` to indicate the function of a cell, or of a row of cells. Its values should be taken from the following list:

- `data` data cell
- `label` label cell
- `sum` row or column sum data
- `total` table total data

For example, Defoe uses mortality tables like the following in the *Journal of the Plague Year* to show the rise and ebb of the epidemic:

```xml
<p>It was indeed coming on amain, for the burials that same week were in the next adjoining parishes thus:-</p>
<table rows="5" cols="4">
  <row role="data">
    <cell role="label">St. Leonard's, Shoreditch</cell>
    <cell>64</cell>
    <cell>84</cell>
    <cell>119</cell>
  </row>
  <row role="data">
    <cell role="label">St. Botolph's, Bishopsgate</cell>
    <cell>65</cell>
    <cell>105</cell>
    <cell>116</cell>
  </row>
  <row role="data">
    <cell role="label">St. Giles's, Cripplegate</cell>
    <cell>213</cell>
    <cell>421</cell>
    <cell>554</cell>
  </row>
</table>
<p>This shutting up of houses was at first counted a very cruel and unchristian method, and the poor people so confined made bitter lamentations. ...</p>
```

9 Figures and Graphics

Not all the components of a document are necessarily textual. The most straightforward text will often contain diagrams or illustrations, to say nothing of documents in which image and text are inextricably intertwined, or electronic resources in which the two are complementary.
The encoder may simply record the presence of a graphic within the text, possibly with a brief description of its content, and may also provide a link to a digitized version of the graphic, using the following elements:

- `<graphic>` indicates the location of a graphic or illustration, either forming part of a text, or providing an image of it.

- `<figure>` groups elements representing or containing graphic information such as an illustration, formula, or figure.

- `<figDesc>` (description of figure) contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

Any textual information accompanying the graphic, such as a heading and/or caption, may be included within the `<figure>` element itself, in a `<head>` and one or more `<p>` elements, as may any text appearing within the graphic itself. It is strongly recommended that a prose description of the image be supplied, as the content of a `<figDesc>` element, for the use of applications which are not able to render the graphic, and to render the document accessible to vision-impaired readers. (Such text is not normally considered part of the document proper.)

The simplest use for these elements is to mark the position of a graphic and provide a link to it, as in this example:

```xml
<figure>
  <graphic url="images/p412fig.png" width="40%"/>
</figure>
```

This indicates that the graphic contained by the file `p412fig.png` appears between pages 412 and 413.

The `<graphic>` element can appear anywhere that textual content is permitted, within but not between paragraphs or headings. In the following example, the encoder has decided to treat a specific printer’s ornament as a heading:

```xml
<head>
  <graphic url="http://www.iath.virginia.edu/gants/Ornaments/Heads/hp-ral02.gif"/>
</head>
```

More usually, a graphic will have at least an identifying title, which may be encoded using the `<head>` element, or a number of figures may be grouped together in a particular structure, as in the following example: The `<figure>` element provides a means of wrapping one or more such elements together as a kind of graphic block. It may also include a brief description of the image:

```xml
<figure>
  <graphic url="images/fezzipic.png"/>
  <head>Mr Fezziwig’s Ball</head>
  <figDesc>A Cruikshank engraving showing Mr Fezziwig leading a group of revellers.</figDesc>
</figure>
```

These cases should be carefully distinguished from the case where an encoded text is complemented by a collection of digital images, maintained as a distinct resource. The `facs` attribute may be used to associate any element in an encoded text with a digital facsimile of it. In the simplest case, the `facs` attribute on the `<pb>` element may be used to supply a location for an image file corresponding with that point in the text:
Figure 3: *Mr Fezziwig’s Ball*: illustration by George Cruikshank from Dickens’ *A Christmas Carol* (1843)
10 Analysis

10.1 Orthographic Sentences

Interpretation typically ranges across the whole of a text, with no particular respect to other structural units. A useful preliminary to intensive interpretation is therefore to segment the text into discrete and identifiable units, each of which can then bear a label for use as a sort of canonical reference. To facilitate such uses, these units may not cross each other, nor nest within each other. They may conveniently be represented using the following element:

<s> (s-unit) contains a sentence-like division of a text.

As the name suggests, the <s> element is most commonly used (in linguistic applications at least) for marking orthographic sentences, that is, units defined by orthographic features such as punctuation. For example, the passage from Jane Eyre discussed earlier might be divided into s-units as follows:

Note that <s> elements cannot nest: the beginning of one <s> element implies that the previous one has finished. When s-units are tagged as shown above, it is advisable to tag the entire text end-to-end, so that every word in the text being analyzed will be contained by exactly one <s> element, whose identifier can then be used to specify a unique reference for it. If the identifiers used are unique within the document, then the xml:id attribute might be used in preference to the n attribute used in the above example.

10.2 Words and Punctuation

Tokenization, that is, the identification of lexical or non-lexical tokens within a text, is a very common requirement for all kinds of textual analysis, and not an entirely trivial one. The
10.3 General-Purpose Interpretation Elements

decision as to whether, for example, can’t in English or du in French should be treated as one word or two is not simple. Consequently it is often useful to make explicit the preferred tokenization in a marked up text. The following elements are available for this purpose:

- `<w>` (word) represents a grammatical (not necessarily orthographic) word.
- `<c>` (character) represents a character.
- `<pc>` (punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark.

For example, the output from a part of speech tagger might be recorded in TEI simplePrint as follows:

```xml
<s n="1">
  <w ana="#NP0">Marley</w>
  <w ana="#VBD">was</w>
  <w ana="#AJ0">dead</w>
  <pc>;</pc>
  <w ana="#TO0">to</w>
  <w ana="#VBB">begin</w>
  <w ana="#PRP">with</w>
  <pc ana="#SENT">.</pc>
</s>
```

In this example, each token in the input has been decorated with an automatically generated part of speech code, using the `ana` attribute discussed in section 3.7.3, Special Kinds of Linking above. The system has also distinguished between tokens to be treated as words (tagged `<w>`) and tokens considered to be punctuation (tagged `<pc>`). It may also sometimes be useful to distinguish tokens which consist of a single letter or character: the `<c>` element is provided for this purpose.

The `<w>` also provides for each word to be associated with a root form or lemma, either explicitly using the `lemma` attribute, or by reference, using the `lemmaRef` attribute, as in this example:

```xml
...<w ana="#VBD" lemma="be" lemmaRef="http://www.myLexicon.com/be">was</w> ...
```

10.3 General-Purpose Interpretation Elements

The `<w>` element is a specialisation of the `<seg>` element which has already been introduced for use in identifying otherwise unmarked targets of cross references and hypertext links (see section 3.7, Cross References and Links); it can be used to distinguish any portion of text to which the encoder wishes to assign a user-specified `type` or a unique identifier; it may thus be used to tag textual features for which there is no other provision in the published TEI Guidelines.

For example, the TEI Guidelines provide no apostrophe element to mark parts of a literary text in which the narrator addresses the reader (or hearer) directly. One approach might be to regard these as instances of the `<q>` element, distinguished from others by an appropriate value for the `who` attribute. A possibly simpler, and certainly more general, solution would however be to use the `<seg>` element as follows:

```xml
<div type="chapter" n="38">
  <p>
    <seg type="apostrophe">Reader, I married him.</seg> A quiet wedding we had:
    ...
  </p>
</div>
```
11 COMMON ATTRIBUTES

The *type* attribute on the `<seg>` element can take any value, and so can be used to distinguish phrase-level phenomena of any kind; it is good practice to record the values used and their significance in the TEI header or in the documentation of the encoding system.

11 Common Attributes

Some attributes are available on many elements, though not on all. These attributes are defined using a TEI attribute class, a concept which is discussed further in the TEI Guidelines. We list here some attribute classes which have been adapted or customized for use in TEI simplePrint.

The elements `<add>`, `<figure>`, `<fw>`, `<label>`, `<note>` and `<stage>` all take the attribute `place` to indicate whereabouts on the page they appear. In TEI simplePrint the possible values for this attribute are limited as indicated below:

- **att.placement** provides attributes for describing where on the source page or object a textual element appears.
  - `@place` specifies where this item is placed.

- **above** above the line
- **below** below the line
- **top** at the top of the page
- **top-right** at the top right of the page
- **top-left** at the top left of the page
- **top-centre** at the top center of the page
- **bottom-right** at the bottom right of the page
- **bottom-left** at the bottom left of the page
- **bottom-centre** at the bottom centre of the page
- **bottom** at the foot of the page
- **tablebottom** underneath a table
- **margin-right** in the right-hand margin
- **margin** in the outer margin
- **margin-inner** in the inner margin
- **margin-left** in the left-hand margin
- **opposite** on the opposite, i.e. facing, page
- **overleaf** on the other side of the leaf
- **overstrike** superimposed on top of the current context
- **end** at the end of the volume
- **divend** at the end of the current division
- **parend** at the end of the current paragraph
- **inline** within the body of the text
inspace in a predefined space, for example left by an earlier scribe

block formatted as an indented paragraph

The elements `<add>`, `<am>`, `<corr>`, `<date>`, `<del>`, `<ex>`, `<expan>`, `<gap>`, `<name>`, `<reg>`, `<space>`, `<subst>`, `<supplied>`, `<time>` and `<unclear>` all use the attribute `unit` to indicate the units in which the size of the feature concerned is expressed. In TEI simplePrint the possible values for this attribute are limited as indicated below:

`att.dimensions` provides attributes for describing the size of physical objects.

  `@unit` names the unit used for the measurement

chars characters

lines lines

pages pages

words words

cm centimetres

mm millimetres

in inches

Very many TEI elements take the value `type` (see the specification for `att.typed` for a full list). In most cases, no constraint is placed on the possible values for this attribute. In the case of the element `<name>` however, the possible values for this attribute are limited as indicated below:

`<name>` (name, proper noun) contains a proper noun or noun phrase.

  `@type` characterizes the element in some sense, using any convenient classification scheme or typology.

12 Composite and Floating Texts

A composite text, like a simple text, has an optional front and back matter. In between however, instead of a single body, it contains one or more discrete texts, each with its own optional front and back matter. The following elements are provided to handle composite texts of various kinds.

<group> contains the body of a composite text, grouping together a sequence of distinct texts (or groups of such texts) which are regarded as a unit for some purpose, for example the collected works of an author, a sequence of prose essays, etc.

-floatingText> contains a single text of any kind, whether unitary or composite, which interrupts the text containing it at any point and after which the surrounding text resumes.

-teiCorpus> contains the whole of a TEI encoded corpus, comprising a single corpus header and one or more <TEI> elements, each containing a single text header and a text.

A typical example might be an anthology containing several distinct works, or any other kind of collection, encoded using an overall structure like this:

```
<TEI xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!--[ header information for the composite ]-->
  </teiHeader>
  <text>
    <!--[ front matter for the composite ]-->
    <front>
    </front>
    <group>
      <text>
        <!--[ front matter of first text ]-->
        <front>
        </front>
        <body>
        <!--[ body of first text ]-->
        </body>
        <back>
        <!--[ back matter of first text ]-->
        <back>
        </back>
        <front>
        <!--[ front matter of second text]-->
        <front>
        </front>
        <body>
        <!--[ body of second text ]-->
        </body>
        <back>
        <!--[ back matter of second text ]-->
        <back>
        </back>
        <!--[ more texts or groups of texts here ]-->
        <group>
        <back>
        <!--[ back matter for the composite ]-->
        <back>
    </text>
  </text>
</TEI>
```

A different kind of composite text occurs when one text is embedded within another, as for example in the Arabian Nights or similar collections of stories, or in other cases where one
narrative is interrupted by another. The element `<floatingText>` may be preferred to encode such materials as the following:

```xml
<p>The Gentleman having finish'd his Story, Galecia waited on him to the Stairs-head; and at her return, casting her Eyes on the Table, she saw lying there an old dirty rumpled Book, and found in it the following story:</p>

```xml
<body>
  <p>IN the time of the Holy War when Christians from all parts went into the Holy Land to oppose the Turks; Amongst these there was a certain English Knight...</p>
</body>

```xml
</floatingText>

```xml
<pb n="43"/>

```xml
<p>By this time Galecia's Maid brought up her Supper; after which she cast her Eyes again on the foresaid little Book, where she found the following Story ....</p>

```

Note that there is only a single TEI header for composite texts of either kind, since the assumption is that the composite is at some level describable as a single work. However, it is also possible to define a composite of complete TEI texts, each with its own TEI header. Such a collection is known as a *TEI corpus*, and must itself have a TEI header:

```xml
<teiCorpus xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!--[header information for the corpus]-->  
  </teiHeader>
  <TEI>
    <teiHeader>
      <!--[header information for first text]-->  
    </teiHeader>
    <text>
      <!--[first text in corpus]-->  
    </text>
  </TEI>
  <TEI>
    <teiHeader>
      <!--[header information for second text]-->  
    </teiHeader>
    <text>
      <!--[second text in corpus]-->  
    </text>
  </TEI>
</teiCorpus>
```

It is also possible to create a composite of corpora – that is, one `<teiCorpus>` element may contain many nested `<teiCorpus>` elements rather than many nested `<TEI>` elements, to any depth considered necessary.
13 Front and Back Matter

13.1 Front Matter

For many purposes, particularly in older texts, the preliminary material such as title pages, prefatory epistles, etc., may provide very useful additional linguistic or social information. The TEI Guidelines provide a set of recommendations for distinguishing the textual elements most commonly encountered in front matter, which are summarized here.

13.1.1 Title Page

The start of a title page should be marked with the element `<titlePage>`. All text contained on the page should be transcribed and tagged with the appropriate element from the following list:

- `<titlePage>` (title page) contains the title page of a text, appearing within the front or back matter.
- `<docTitle>` (document title) contains the title of a document, including all its constituents, as given on a title page.
- `<titlePart>` contains a subsection or division of the title of a work, as indicated on a title page.
- `<byline>` contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.
- `<docAuthor>` (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline).
- `<docDate>` (document date) contains the date of a document, as given on a title page or in a dateline.
- `<docImprint>` (document imprint) contains the imprint statement (place and date of publication, publisher name), as given (usually) at the foot of a title page.
- `<epigraph>` contains a quotation, anonymous or attributed, appearing at the start or end of a section or on a title page.

Typeface distinctions should be marked with the `rendition` attribute when necessary, as described above though a very detailed description of the letter spacing and sizing used in ornamental titles is not easily done. Changes of language should be marked by appropriate use of the `xml:lang` attribute or the `<foreign>` element, as necessary. Names of people, places, or organizations, may be tagged using the `<name>` element wherever they appear if no other more specific element is available.

Two example title pages follow:

```
<titlePage>
  <docTitle>
    <titlePart type="main">PARADISE REGAIN'D. A POEM In IV</titlePart>
    <hi>BOO</hi><titlePart>
    To which is added <title>SAMSON AGONISTES</title>.
  </docTitle>
  <byline>The Author <docAuthor>JOHN MILTON</docAuthor></byline>
  <docImprint>
    <name>LONDON</name>, Printed by <name>J.M.</name> for <name>John Starkey</name> at the <name>Mitre</name> in <name>Fleetstreet</name>, near <name>Temple-Bar</name>.<name></name>
  </docImprint>
  <docDate>MDCLXXI</docDate>
</titlePage>
```
<titlePage>
<docTitle>
<titlePart type="main">Lives of the Queens of England, from the Norman Conquest;</<titlePart>
<titlePart type="sub">with anecdotes of their courts.</titlePart>
</docTitle>
<titlePart>Now first published from Official Records and other authentic documents private as well as public.</titlePart>
<byline>By <docAuthor>Agnes Strickland</docAuthor>
</byline>
<epigraph><q>The treasures of antiquity laid up in old historic rolls, I opened.</q><bibl>BEAUMONT</bibl>
</epigraph>
<docImprint>Philadelphia: Blanchard and Lea</docImprint>
<docDate>1860.</docDate>
</titlePage>

As elsewhere, the ref attribute may be used to link a name with a canonical definition of the entity being named. For example:

<byline>By <docAuthor><name ref="http://en.wikipedia.org/wiki/Agnes_Strickland">Agnes Strickland</name></docAuthor></byline>

13.1.2 Prefatory Matter
Major blocks of text within the front matter should be marked using <div> elements; the following suggested values for the type attribute may be used to distinguish various common types of prefatory matter:

preface A foreword or preface addressed to the reader in which the author or publisher explains the content, purpose, or origin of the text.

dedication A formal offering or dedication of a text to one or more persons or institutions by the author.

abstract A summary of the content of a text as continuous prose.

ack A formal declaration of acknowledgment by the author in which persons and institutions are thanked for their part in the creation of a text.

contents A table of contents, specifying the structure of a work and listing its constituents. The <list> element should be used to mark its structure.

frontispiece A pictorial frontispiece, possibly including some text.

Where other kinds of prefatory matter are encountered, the encoder is at liberty to invent other values for the type attribute.

13.1.3 Liminal Elements
All text divisions, whether in front matter or elsewhere, may begin and end with one or more components which we term liminal elements, because they begin or end the division. A typical example is a heading or title of some kind which should be tagged using the <head> element; but there are many other possibilities:
<salute> (salutation) contains a salutation or greeting prefixed to a foreword, dedicatory epistle, or other division of a text, or the salutation in the closing of a letter, preface, etc.

<signed> (signature) contains the closing salutation, etc., appended to a foreword, dedicatory epistle, or other division of a text.

<byline> contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.

<dateline> contains a brief description of the place, date, time, etc. of production of a letter, newspaper story, or other work, prefixed or suffixed to it as a kind of heading or trailer.

<argument> contains a formal list or prose description of the topics addressed by a subdivision of a text.

<cit> (cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example.

<imprimatur> contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<opener> groups together dateline, byline, salutation, and similar phrases appearing as a preliminary group at the start of a division, especially of a letter.

<closer> groups together salutations, datelines, and similar phrases appearing as a final group at the end of a division, especially of a letter.

<postscript> contains a postscript, e.g. to a letter.

As an example, the beginning and end of the dedication to Milton’s *Comus* might be marked up as follows:

```xml
<div type="dedication">
  <head>To the Right Honourable <name>JOHN Lord Viscount BRACLY</name>, Son and Heir apparent to the Earl of Bridgewater, &c.</head>
  <salute>MY LORD,</salute>
  <p>This <hi>Poem</hi>, which receiv'd its first occasion of Birth from your Self, and others of your Noble Family .... and as in this representation your attendant <name>Thyrsis</name>, so now in all reall expression</p>
  <closer>
    <salute>Your faithfull, and most humble servant</salute>
    <signed>
      <name>H. LAWES.</name>
    </signed>
  </closer>
</div>
```

13.2 Back Matter

13.2.1 Structural Divisions of Back Matter

Because of variations in publishing practice, back matter can contain virtually any of the elements listed above for front matter, and the same elements should be used where this is so. Additionally, back matter may contain the following types of matter within the `<back>` element. Like the structural divisions of the body, these should be marked as `<div>` elements, and distinguished by the following suggested values of the `type` attribute:

**appendix** An ancillary self-contained section of a work, often providing additional but in some sense extra-canonical text.
13.2 Back Matter

glossary A list of terms associated with definition texts (glosses): this should be encoded as a `<list type="gloss">` element.

notes A section in which textual or other kinds of notes are gathered together.

bibliogr A list of bibliographic citations: this should be encoded as a `<listBibl>`.

index Any form of pre-existing index to the work

colophon A statement appearing at the end of a book describing the conditions of its physical production.

13.2.2 Specialized Front and Back Matter

TEI simplePrint also provides elements for some additional components of front or back matter which are characteristic of particular kinds of text, in particular old play texts. These often include lists of dramatis personae and notes about the setting of a play, for which the following elements are provided:

`<castList>` (cast list) contains a single cast list or dramatis personae.

`<castItem>` (cast list item) contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.

`<castGroup>` (cast list grouping) groups one or more individual `<castItem>` elements within a cast list.

`<role>` contains the name of a dramatic role, as given in a cast list.

`<roleDesc>` (role description) describes a character’s role in a drama.

`<actor>` contains the name of an actor appearing within a cast list.

`<set>` (setting) contains a description of the setting, time, locale, appearance, etc., of the action of a play, typically found in the front matter of a printed performance text (not a stage direction).

Note that these elements are intended for use in marking up cast lists and setting notes as they appear in a source document. They are not intended for use when marking up definitive lists of the different roles identified in a play, except in so far as that may have been their original purpose.

The following example shows one way of encoding the last part of Shakespeare’s *Tempest*, as printed in the first folio:

```xml
<back>
  <div type="epilogue">
    <head>Epilogue, spoken by Prospero.</head>
    <sp>
      <l>Now my Charmes are all ore-throwne,</l>
      <l>And what strength I have's mine owne</l>
      <l>As you from crimes would pardon'd be,</l>
      <l>Let your Indulgence set me free.</l>
    </sp>
    <stage>Exit</stage>
  </div>
  <set>
    <p>The Scene, an un-inhabited Island.</p>
  </set>
  <castList>
    <head>Names of the Actors.</head>
    <castItem>Alonso, K. of Naples</castItem>
    <castItem>Sebastian, his Brother.</castItem>
    <castItem>Prospero, the right Duke of Millaine.</castItem>
  </castList>
</back>
```
14 Encoding a Digital Facsimile

The following elements may be used to encode a text represented by a collection of digital images, either alone or in conjunction with a textual transcription.

\texttt{<facsimile>} contains a representation of some written source in the form of a set of images rather than as transcribed or encoded text.

\texttt{<surface>} defines a written surface as a two-dimensional coordinate space, optionally grouping one or more graphic representations of that space, zones of interest within that space, and transcriptions of the writing within them.

\texttt{<zone>} defines any two-dimensional area within a \texttt{<surface>} element.

As mentioned in section 9. Figures and Graphics above, a TEI simplePrint document may reference a set of page images, alone, or in combination with a transcription. For ease of management, it is strongly recommended that the \texttt{<graphic>} elements representing those page images be grouped together within a \texttt{<facsimile>} element, as in the following example:

\begin{verbatim}
<facsimile>
  <graphic url="page1.png" xml:id="page1"/>
  <graphic url="page2.png" xml:id="page2"/>
</facsimile>
\end{verbatim}

If a transcription is supplied in addition, the \texttt{xml:id} values can be used to align the page breaks within it with the relevant image, rather than using the URL given on the \texttt{<graphic>} element.

\begin{verbatim}
<text>
  <!-- ... -->
  <pb facs="#page1"/>
  <!-- text contained on page 1 -->
  <pb facs="#page2"/>
  <!-- text contained on page 2 -->
  <!-- ... -->
</text>
\end{verbatim}

The \texttt{<surface>} element is useful in two situations: when it is desired to group different images of the same page, for example of different resolutions; and when it is desired to align parts of a page image with parts of a transcription. The \texttt{<zone>} element is used to define (and hence provide an identifier for) the location of a part of an image with reference to the surface on which it appears.

In this example, a thumbnail and a high resolution image are associated with the same surface:

\begin{verbatim}
<facsimile>
  <surface>
    <graphic xml:id="page1T"
      url="thumbs/page1.png"/>
    <graphic xml:id="page1" url="pagel.png"/>
  </surface>
</facsimile>
\end{verbatim}

In this example, the \texttt{<head>} element in the transcription is aligned with the top half of a square image:
A more detailed explanation of the use of these attributes and other associated elements is given in the full TEI Guidelines.

15 The Electronic Title Page

Every TEI text has a header which provides information analogous to that provided by the title page of printed text. The header is introduced by the element `<teiHeader>` and has four major parts:

- `<fileDesc>` (file description) contains a full bibliographic description of the file.
- `<encodingDesc>` (encoding description) documents the relationship between an electronic text and the source or sources from which it was derived.
- `<profileDesc>` (text-profile description) provides a detailed description of non-bibliographic aspects of a text, specifically the languages and sublanguages used, the situation in which it was produced, the participants and their setting.
- `<revisionDesc>` (revision description) summarizes the revision history for a file.

A corpus or collection of texts with many shared characteristics may have one header for the corpus and individual headers for each component of the corpus. In this case the `type` attribute indicates the type of header. `<teiHeader type="corpus">` introduces the header for corpus-level information.

Some of the header elements contain running prose which consists of one or more `<p>`s. Others are grouped:

- Elements whose names end in `Stmt` (for statement) usually enclose a group of elements recording some structured information.
- Elements whose names end in `Decl` (for declaration) enclose information about specific encoding practices.
- Elements whose names end in `Desc` (for description) contain a prose description.

15.1 The File Description

The `<fileDesc>` element is mandatory. It contains a full bibliographic description of the file with the following elements:

- `<titleStmt>` (title statement) groups information about the title of a work and those responsible for its content.
- `<editionStmt>` (edition statement) groups information relating to one edition of a text.
- `<extent>` describes the approximate size of a text stored on some carrier medium or of some other object, digital or non-digital, specified in any convenient units.
15.1.1 The Title Statement

The following elements can be used in the `<titleStmt>` to provide information about the title of a work and those responsible for its content:

- `<title>` contains a title for any kind of work.
- `<author>` in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority.
- `<respStmt>` (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work.

The title of a digital resource derived from a non-digital original may be similar to that of its source but should be distinct from it, for example: `[title of source]: TEI XML edition` or `A machine readable version of: [title of source]`

The generic `<respStmt>` element may be used to indicate any kind of responsibility, ranging from a funder or sponsor to an illustrator or editor. It contains the following subcomponents:

- `<resp>` (responsibility) contains a phrase describing the nature of a person’s intellectual responsibility, or an organization’s role in the production or distribution of a work.
- `<name>` (name, proper noun) contains a proper noun or noun phrase.

Example:

```
<titleStmt>
<title>Two stories by Edgar Allen Poe</title>
<author>Poe, Edgar Allen (1809-1849)</author>
```
15.1 The File Description

**15.1.2 The Edition Statement**

The `<editionStmt>` groups information relating to one edition of the digital resource (where *edition* is used as elsewhere in bibliography), and may include the following elements:

- `<edition>` describes the particularities of one edition of a text.
- `<respStmt>` (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work.

Example:

```xml
<editionStmt>
  <edition n="U2">Third draft, substantially revised <date>1987</date>
</edition>
</editionStmt>
```

Determining exactly what constitutes a new edition of an electronic text is left to the encoder.

**15.1.3 The Extent Statement**

The `<extent>` statement describes the approximate size of the digital resource.

Example:

```xml
<extent>15 Mb</extent>
```

**15.1.4 The Publication Statement**

The `<publicationStmt>` is mandatory. It may contain a simple prose description or groups of the elements described below:

- `<publisher>` provides the name of the organization responsible for the publication or distribution of a bibliographic item.
- `<distributor>` supplies the name of a person or other agency responsible for the distribution of a text.

At least one of these elements must be present, unless the entire publication statement is in prose. The following elements may occur within them:

- `<pubPlace>` (publication place) contains the name of the place where a bibliographic item was published.
- `<address>` contains a postal address, for example of a publisher, an organization, or an individual.
- `<addrLine>` (address line) contains one line of a postal address.
- `<idno>` (identifier) supplies any form of identifier used to identify some object, such as a bibliographic item, a person, a title, an organization, etc. in a standardized way.
supplies information about the availability of a text, for example any restrictions on its use or distribution, its copyright status, any licence applying to it, etc.

contains information about a licence or other legal agreement applicable to the text.

date contains a date in any format.

Example:

<publicationStmt>
  <publisher>University of Victoria Humanities Computing and Media Centre</publisher>
  <pubPlace>Victoria, BC</pubPlace>
  <date>2011</date>
  <availability status="restricted">
    <licence target="http://creativecommons.org/licenses/by-sa/3.0/">Distributed under a Creative Commons Attribution-ShareAlike 3.0 Unported License</licence>
  </availability>
</publicationStmt>

15.1.5 Series and Notes Statements

The seriesStmt element groups information about the series, if any, to which a publication belongs. It may contain title, idno, or respStmt elements.

The notesStmt, if used, contains one or more note elements which contain a note or annotation. Some information found in the notes area in conventional bibliography has been assigned specific elements in the TEI scheme.

15.1.6 The Source Description

The sourceDesc is a mandatory element which records details of the source or sources from which the computer file is derived. It may contain simple prose or a bibliographic citation, using one or more of the following elements:

(bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.

(citation list) contains a list of bibliographic citations of any kind.

Examples:

<sourceDesc>
  <bibl>The first folio of Shakespeare, prepared by Charlton Hinman (The Norton Facsimile, 1968)</bibl>
</sourceDesc>

<sourceDesc>
  <bibl>
    <author>CNN Network News</author>
    <title>News headlines</title>
    <date>12 Jun 1989</date>
  </bibl>
</sourceDesc>

15.2 The Encoding Description

The encodingDesc element specifies the methods and editorial principles which governed the transcription of the text. Its use is highly recommended. It may be prose description or may contain more specialized elements chosen from the following list:
15.2 The Encoding Description

<projectDesc> (project description) describes in detail the aim or purpose for which an electronic file was encoded, together with any other relevant information concerning the process by which it was assembled or collected.

<samplingDecl> (sampling declaration) contains a prose description of the rationale and methods used in sampling texts in the creation of a corpus or collection.

<editorialDecl> (editorial practice declaration) provides details of editorial principles and practices applied during the encoding of a text.

<tagsDecl> (tagging declaration) provides detailed information about the tagging applied to a document.

<refsDecl> (references declaration) specifies how canonical references are constructed for this text.

<listPrefixDef> (list of prefix definitions) contains a list of definitions of prefixing schemes used in teidata.pointer values, showing how abbreviated URIs using each scheme may be expanded into full URIs.

<prefixDef> (prefix definition) defines a prefixing scheme used in teidata.pointer values, showing how abbreviated URIs using the scheme may be expanded into full URIs.

<classDecl> (classification declarations) contains one or more taxonomies defining any classificatory codes used elsewhere in the text.

<charDecl> (character declarations) provides information about nonstandard characters and glyphs.

15.2.1 Project Description and Sampling Declaration

Examples of <projectDesc> and <samplingDecl>:

```
<encodingDesc>
  <projectDesc>
    <p>Texts collected for use in the Claremont Shakespeare Clinic, June 1990. </p>
  </projectDesc>
</encodingDesc>
```

```
<encodingDesc>
  <samplingDecl>
    <p>Samples of 2000 words taken from the beginning of the text</p>
  </samplingDecl>
</encodingDesc>
```

15.2.2 Editorial Declarations

The <editorialDecl> contains a prose description of the practices used when encoding the text. Typically this description should cover such topics as the following, each of which may conveniently be given as a separate paragraph:

**correction** how and under what circumstances corrections have been made in the text.

**normalization** the extent to which the original source has been regularized or normalized.

**quotation** what has been done with quotation marks in the original – have they been retained or replaced by entity references, are opening and closing quotes distinguished, etc.

**hyphenation** what has been done with hyphens (especially end-of-line hyphens) in the original – have they been retained, replaced by entity references, etc.
segmentation how has the text been segmented, for example into sentences, tone-units, graphemic strata, etc.

interpretation what analytic or interpretive information has been added to the text.

Example:

```xml
<editorialDecl>
  <p>The part of speech analysis applied throughout section 4 was added by hand and has not been checked.</p>
  <p>Errors in transcription controlled by using the WordPerfect spelling checker.</p>
  <p>All words converted to Modern American spelling using Webster’s 9th Collegiate dictionary.</p>
</editorialDecl>
```

The full TEI Guidelines provide specialized elements for each of the topics above; these are not however included in TEI simplePrint.

15.2.3 Tagging Declaration

When it does not consist simply of a prose description, the `<tagsDecl>` element may contain a number of more specialized elements providing additional information about how the document concerned has been marked up. The following elements may be used:

- `<rendition>` supplies information about the rendition or appearance of one or more elements in the source text.
- `<namespace>` supplies the formal name of the namespace to which the elements documented by its children belong.
- `<tagUsage>` documents the usage of a specific element within a specified document.

Here is a simple example, showing how these elements may be used. It indicates the number of times the elements `<hi>` and `<title>` from the TEI namespace have been used in the document. It also documents how the way that the source document was originally printed has been represented using TEI tagging:

```xml
<tagsDecl partial="true">
  <rendition xml:id="rend-bo">font-weight:bold</rendition>
  <rendition xml:id="rend-it" selector="hi, title">font-style:italic</rendition>
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="467"/>
    <tagUsage gi="title" occurs="45"/>
  </namespace>
</tagsDecl>
```

The `<rendition>` elements here contain fragments expressed in the W3C standard Cascading Stylesheets language (CSS). Their function here is to associate the particular styles concerned with an identifier (for example `rend-bo`) which can then be pointed to from elsewhere within the document by means of the `rendition` attribute mentioned in section 3.5.1. Changes of Typeface, etc. above. To indicate, for example, that a particular name in the document was rendered in a bold font it might be tagged `<name rendition="#rend-bo">`. The `selector` attribute used in the preceding example is used to indicate once for all a default rendition value to be associated with several elements: in this example, unless otherwise indicated, it is assumed that the content of each `<hi>` and each `<title>` element was originally rendered using an italic font.

For TEI simplePrint, a large set of such rendition definitions has been predefined. The encoder is not therefore required to supply any detailed declarations, but can refer to the predefined list using the following list:
simple:allcaps  all capitals
simple:blackletter  black letter or gothic typeface
simple:bold  bold typeface
simple:bottombraced  marked with a brace under the bottom of the text
simple:boxed  border around the text
simple:centre  centred text
simple:cursive  cursive typeface
simple:display  block display
simple:doublestrikethrough  strikethrough with double line
simple:doubleunderline  underlined with double line
simple:dropcap  initial letter larger or decorated
simple:float  floated out of main flow
simple:hyphen  with a hyphen here (e.g. in line break)
simple:inline  inline rendering
simple:justify  justified text
simple:italic  italic typeface
simple:larger  larger type
simple:left  aligned to the left or left-justified
simple:leftbraced  marked with a brace on the left side of the text
simple:letterspace  larger-than-normal spacing between letters, usually for emphasis
simple:literal  fixed-width typeface, spacing preserved
simple:normalstyle  upright shape and default weight of typeface
simple:normalweight  normal typeface weight
simple:right  aligned to the right or right-justified
simple:rightbraced  marked with a brace to the right of the text
simple:rotateleft  rotated to the left
simple:rotateright  rotated to the right
simple:smallcaps  small caps
simple:smaller  smaller type
simple:subscript  subscript
15.2.4 Reference, Prefix, and Classification Declarations

The `<refsDecl>` element is used to document the way in which any standard referencing scheme built into the encoding works. In its simplest form, it consists of prose description.

Example:

```
<refsDecl>
  <p>The @n attribute on each <div> element contains the canonical reference for each division in the form XX.yyy where XX is the book number in roman numeral and yyy is the section number in arabic.</p>
  <p>Milestone tags refer to the edition of 1830 as E30 and that of 1850 as E50.</p>
</refsDecl>
```

The `<listPrefixDef>` element contains one or more `<prefixDef>` elements, each defining a prefix which has been used to abbreviate references to other documents, for example as the value of a `target` or other pointing attribute. The definition provides information about how the prefix can be translated automatically into a full URL, as in the following example:

```
<listPrefixDef>
  <prefixDef idEnt="psn"
    matchPattern="([A-Z]+)"
    replacementPattern="http://www.example.com/personography.xml#$1"/>
</listPrefixDef>
```

In this case, a pointer value in the form psn:MDH would be translated to http://www.example.com/personography.xml#MDH.

The `<classDecl>` element groups together definitions or sources for any descriptive classification schemes or taxonomies used by other parts of the header. These schemes may be defined in a number of different ways, using one or more of the following elements:

- `<taxonomy>` defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.
- `<bibl>` (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.
- `<category>` contains an individual descriptive category, possibly nested within a superordinate category, within a user-defined taxonomy.
- `<catDesc>` (category description) describes some category within a taxonomy or text typology, either in the form of a brief prose description or in terms of the situational parameters used by the TEI formal `<textDesc>`.
In the simplest case, the taxonomy may be defined by a bibliographic reference, as in the following example:

```xml
<classDecl>
  <taxonomy xml:id="LC-SH">
    <bibl>Library of Congress Subject Headings</bibl>
  </taxonomy>
</classDecl>
```

Alternatively, or in addition, the encoder may define a special purpose classification scheme, as in the following example:

```xml
<taxonomy xml:id="B">
  <bibl>Brown Corpus</bibl>
  <category xml:id="B.A">
    <catDesc>Press Reportage</catDesc>
    <category xml:id="B.A1">
      <catDesc>Daily</catDesc>
    </category>
    <category xml:id="B.A2">
      <catDesc>Sunday</catDesc>
    </category>
    <category xml:id="B.A3">
      <catDesc>National</catDesc>
    </category>
    <category xml:id="B.A4">
      <catDesc>Provincial</catDesc>
    </category>
    <category xml:id="B.A5">
      <catDesc>Political</catDesc>
    </category>
    <category xml:id="B.A6">
      <catDesc>Sports</catDesc>
    </category>
  </category>
  <category xml:id="B.D">
    <catDesc>Religion</catDesc>
    <category xml:id="B.D1">
      <catDesc>Books</catDesc>
    </category>
    <category xml:id="B.D2">
      <catDesc>Periodicals and tracts</catDesc>
    </category>
  </category>
</taxonomy>
```

Linkage between a particular text and a category within such a taxonomy is made by means of the `<catRef>` element within the `<textClass>` element, as described in the next section.

### 15.2.5 The character declaration

As mentioned in section 5.2. *Formulae, Codes, and Special Characters* above, the element `<g>` is used to indicate the presence of a nonstandard character or glyph in a transcription, and to reference a definition or description of it in the Header. These definitions are provided by means of the following specialised elements given within the `<charDecl>` component of the `<encodingDesc>`:

- `<char>` (character) provides descriptive information about a character.
- `<glyph>` (character glyph) provides descriptive information about a character glyph.
15.3 The Profile Description

The `<profileDesc>` element gathers together information about various descriptive aspects of a text. It has the following optional components:

- `<creation>` contains information about the creation of a text.
- `<abstract>` contains a summary or formal abstract prefixed to an existing source document by the encoder.
- `<particDesc>` (participation description) describes the identifiable speakers, voices, or other participants in any kind of text or other persons named or otherwise referred to in a text, edition, or metadata.
- `<settingDesc>` (setting description) describes the setting or settings within which a language interaction takes place, or other places otherwise referred to in a text, edition, or metadata.
- `<langUsage>` (language usage) describes the languages, sublanguages, registers, dialects, etc. represented within a text.
- `<textClass>` (text classification) groups information which describes the nature or topic of a text in terms of a standard classification scheme, thesaurus, etc.

The `<creation>` element documents where a work was created, even though it may not have been published or recorded there:

Example:

```xml
<creation>
  <date when="1992-08">August 1992</date>
  <name type="place">Taos, New Mexico</name>
</creation>
```

The `<abstract>` element may be used to provide a brief summary or abstract of the document concerned. It is most usually applied to texts born digital:
<p>This paper is a draft studying various aspects of using the TEI as a reference serialization framework for LMF. Comments are welcome to bring this to a useful document for the community.</p>

The `<particDesc>` element is used to list descriptive information about the real or fictional participants in a text, for example the characters in a novel or a play. It contains at least one `<listPerson>` element, which contains individual `<person>` elements. `<listPerson>` (list of persons) contains a list of descriptions, each of which provides information about an identifiable person or a group of people, for example the participants in a language interaction, or the people referred to in a historical source. `<person>` provides information about an identifiable individual, for example a participant in a language interaction, or a person referred to in a historical source.

For example:

```xml
<profileDesc>
  <particDesc>
    <listPerson>
      <person xml:id="OPI">
        <p>
          <name>Dr Opimian</name>: named for the famous Roman fine wine.
        </p>
      </person>
      <person xml:id="GRM">
        <p>
          <name>Mr Gryll</name>: named for the mythical Gryllus, one of Ulysses’ sailors transformed by Circe into a pig, who argues that he was happier in that state than as a man.
        </p>
      </person>
    </listPerson>
  </particDesc>
</profileDesc>
```

In the same way, the `<settingDesc>` element can be used to list descriptive information about the real or fictional places mentioned in a text. It contains at least one `<listPlace>` element, which contains individual `<place>` elements. `<listPlace>` (list of places) contains a list of places, optionally followed by a list of relationships (other than containment) defined amongst them. `<place>` contains data about a geographic location.

For example:

```xml
<profileDesc>
  <settingDesc>
    <listPlace>
      <head>Houses mentioned in <title>Pride and Prejudice</title></head>
      <place xml:id="NETF1">
        <p>
          <name>Netherfield Park</name>: home of the Bingleys
        </p>
      </place>
      <place xml:id="PEMB1">
        <p>
          <name>Pemberley</name>: home of Mr Darcy
        </p>
      </place>
    </listPlace>
  </settingDesc>
</profileDesc>
```
The full TEI Guidelines provide a rich range of additional elements to define more structured information about persons and places; these are not however available in TEI Simple.

The `<langUsage>` element is useful where a text contains many different languages. It may contain `<language>` elements to document each particular language used:

- `<language>` characterizes a single language or sublanguage used within a text.

For example, a text containing predominantly text in French as spoken in Quebec, but also smaller amounts of British and Canadian English might be documented as follows:

```xml
<langUsage>
  <language ident="fr-CA" usage="60">Québecois</language>
  <language ident="en-CA" usage="20">Canadian Business English</language>
  <language ident="en-GB" usage="20">British English</language>
</langUsage>
```

The `<textClass>` element classifies a text. This may be done with reference to a classification system locally defined by means of the `<classDecl>` element, or by reference to some externally defined established scheme such as the Universal Decimal Classification. Texts may also be classified using lists of keywords, which may themselves be drawn from locally or externally defined control lists. The following elements are used to supply such classifications:

- `<classCode>` (classification code) contains the classification code used for this text in some standard classification system.
- `<catRef>` (category reference) specifies one or more defined categories within some taxonomy or text typology.
- `<keywords>` contains a list of keywords or phrases identifying the topic or nature of a text.

The simplest way of classifying a text is by means of the `<classCode>` element. For example, a text with classification 410 in the Universal Decimal Classification might be documented as follows:

```xml
<classCode scheme="http://www.udc.org">410</classCode>
```

When a classification scheme has been locally defined using the `<taxonomy>` element discussed in the preceding subsection, the `<catRef>` element should be used to reference it. To continue the earlier example, a work classified in the Brown Corpus as Press reportage - Sunday and also as Religion might be documented as follows:

```xml
<catRef target="#B.A3 #B.D"/>
```

The element `<keywords>` contains one or more keywords or phrases identifying the topic or nature of a text, each tagged as a `<term>`. As usual, the attribute `scheme` identifies the source from which these terms are taken. For example, if the LC Subject Headings are used, following declaration of that classification system in a `<taxonomy>` element as above:
Multiple classifications may be supplied using any of the mechanisms described in this section.

15.4 Other forms of metadata
The TEI header was one of the first attempts to provide a full range of metadata elements, but it is by no means the only standard now used for this purpose. To facilitate the management of large digital collections and to simplify interoperability of TEI and non-TEI resources, the following element may be found useful:

\(<xenoData>\) (non-TEI metadata) provides a container element into which metadata in non-TEI formats may be placed.

A typical use for this element might be to store a set of descriptors conforming to the Dublin Core standard in the TEI header rather than to generate them automatically from the corresponding TEI elements. For examples and discussion, see the TEI Guidelines at http://www.tei-c.org/release/doc/tei-p5-doc/en/html/HD.html#HD9

15.5 The Revision Description
The \(<revisionDesc>\) element provides a change log in which each significant change made to a text may be recorded. It is always the last element in a \(<teiHeader>\) and contains the following elements:

\(<change>\) documents a change or set of changes made during the production of a source document, or during the revision of an electronic file.

\(<listChange>\) groups a number of change descriptions associated with either the creation of a source text or the revision of an encoded text.

Each \(<change>\) element contains a brief description of a significant change. The attributes when and who may be used to identify when the change was carried out and the person responsible for it.

It is good practice (but not required) to group changes together within a \(<listChange>\) element.

Example:

\(<revisionDesc>\n\<listChange>\n\<change when="1991-11-11" who="#LB">deleted chapter 10</change>\n\<change when="1991-11-02" who="#MSM">completed first draft</change>\n\</listChange>\n\</revisionDesc>\n
In a production environment it will usually be found preferable to use some kind of automated system to track and record changes. Many such version control systems, as they are known, can also be configured to update the TEI header of a file automatically.

16 The Simple Processing Model
Unlike most other TEI customizations, TEI simplePrint includes documentation of the intended processing associated with the majority of elements. As noted above, the TEI provides components such as the rendition attribute to indicate the appearance of particular parts of a
document in the non-digital source from which it is derived. With TEI simplePrint, it is also possible to indicate how in general an element should be processed, in particular its intended appearance when processed for display on a screen or on paper. This ability derives from a number of capabilities recently added to the TEI architecture for the specification of processing, which were developed as part of the project that defined the TEI simplePrint schema.

The key feature of this Processing Model is a notation that allows the encoder to associate each element with one or more categories, which we call its *behaviours*. In addition, the Processing Model indicates how the element should be rendered, possibly differently in differing circumstances, using the W3C Cascading Style Sheets (CSS) mentioned above. It is consequently much easier to develop processors for documents conforming to TEI simplePrint, since the complexity of the task is much reduced.

Twenty-five different behaviours are currently defined by the TEI Processing Model. Their names indicate informally the categorization concerned, and should be readily comprehensible for most programmers. The following table indicates the TEI simplePrint elements associated with each:

<table>
<thead>
<tr>
<th>Behaviour Used by</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternate choice date</td>
<td>support display of alternative visualizations, for example by displaying the preferred content, by displaying both in parallel, or by toggling between the two.</td>
</tr>
<tr>
<td>anchor anchor</td>
<td>create an identifiable anchor point in the output.</td>
</tr>
<tr>
<td>block address addrLine argument back body byline closer dateline div docTitle epigraph figure floatingText formula front fw group head imprimatur l lg listBibl note opener postscript q quote role roleDesc salute signed sp speaker spGrp stage titlePage titlePart trailer</td>
<td>create a block structure</td>
</tr>
<tr>
<td>body text</td>
<td>create the body of a document</td>
</tr>
<tr>
<td>break cb lb pb</td>
<td>create a line, column, or page break according to the value of type</td>
</tr>
<tr>
<td>cell cell</td>
<td>create a table cell</td>
</tr>
<tr>
<td>cit cit</td>
<td>show the content, with an indication of the source</td>
</tr>
<tr>
<td>documentTEI</td>
<td>start a new output document</td>
</tr>
<tr>
<td>glyph g</td>
<td>show a character by looking up reference to a chardesc at the given URI</td>
</tr>
<tr>
<td>graphic graphic</td>
<td>if URL is present, use it to display graphic, else display a placeholder image</td>
</tr>
<tr>
<td>heading head</td>
<td>creates a heading</td>
</tr>
<tr>
<td>index body</td>
<td>generate list according to type</td>
</tr>
</tbody>
</table>
The TEI simplePrint schema

Like other TEI customizations, TEI simplePrint is defined by reference to the TEI Guidelines. The following reference documentation provides formal specifications for each element, model class, attribute class, macro and datatype it uses. These concepts are further explained in the TEI Guidelines.

Specifications are provided here for each component which has been modified for inclusion in TEI simplePrint. Almost every textual element has been modified, if only to include a processing model component. Note that the cross references included in these specifications are to the section of the full TEI Guidelines where the subject is treated, and not to sections of the present document.

17.1 Elements

〈TEI〉 (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the model.resource class. Multiple 〈TEI〉 elements may be combined within a 〈TEI〉 or 〈teiCorpus〉 element. [4. Default Text Structure [15.1. Varieties of Composite Text]]

core: teiCorpus

May contain header: teiHeader
textstructure: TEI text
transcr: facsimile

Note This element is required. It is customary to specify the TEI namespace http://www.tei-c.org/ns/1.0 on it, using the xmlns attribute.

Example

```xml
<TEI version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <fileDesc>
      <titleStmt>
        <title>The shortest TEI Document Imaginable</title>
      </titleStmt>
      <publicationStmt>
        <p>First published as part of TEI P2, this is the P5 version using a name space.</p>
      </publicationStmt>
      <sourceDesc>
        <p>No source: this is an original work.</p>
      </sourceDesc>
    </fileDesc>
  </teiHeader>
  <text>
    <body>
      <p>This is about the shortest TEI document imaginable.</p>
    </body>
  </text>
</TEI>
```

Example

```xml
<TEI version="2.9.1" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <fileDesc>
      <titleStmt>
        <title>A TEI Document containing four page images</title>
      </titleStmt>
      <publicationStmt>
        <p>Unpublished demonstration file.</p>
      </publicationStmt>
      <sourceDesc>
        <p>No source: this is an original work.</p>
      </sourceDesc>
    </fileDesc>
  </teiHeader>
  <facsimile>
    <graphic url="page1.png"/>
    <graphic url="page2.png"/>
    <graphic url="page3.png"/>
  </facsimile>
</TEI>
```

 attrib.global.analytic (@ana) attrib.global.facs (@facs) attrib.global.responsibility (@cert, @resp) (attrib.global.source (@source)) attrib.typed (@type, @subtype)

@type allows the encoder to classify the abbreviation according to some convenient typology.

Derived from attrib.typed

Status Optional

Datatype teidata.enumerated

Sample values include: suspension the abbreviation provides the first letter(s) of the word or phrase, omitting the remainder. 

collection the abbreviation omits some letter(s) in the middle.

brevigraph the abbreviation comprises a special symbol or mark.

superscription the abbreviation includes writing above the line.

acronym the abbreviation comprises the initial letters of the words of a phrase.

title the abbreviation is for a title of address (Dr, Ms, Mr, …)

organization the abbreviation is for the name of an organization.

geographic the abbreviation is for a geographic name.

Note This element is intended only for cases where no abstract is available in the original source. Any abstract already present in the source document should be encoded as a <div> within the <front>, as it should for a born-digital document.

Example

<pre>
<profileDesc>
  <abstract resp="#LB">
    <p>Good database design involves the acquisition and deployment of skills which have a wider relevance to the educational process. From a set of more or less instinctive rules of thumb a formal discipline or "methodology" of database design has evolved. Applying that methodology can be of great benefit to a very wide range of academic subjects: it requires fundamental skills of abstraction and generalisation and it provides a simple mechanism whereby complex ideas and information structures can be represented and manipulated, even without the use of a computer. </p>
  </abstract>
</profileDesc>

<add> (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector. [3.4.3. Additions, Deletions, and Omissions]

Module core

Attributes

att.global (xml:id, @n, xml:lang, xml:base, xml:space)
(att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
May contain

Note In a diplomatic edition attempting to represent an original source, the <add> element should not be used for additions to the current TEI electronic edition made by editors or encoders. In these cases, either the <corr> or <supplied> element are recommended.

In a TEI edition of a historical text with previous editorial emendations in which such additions or reconstructions are considered part of the source text, the use of <add> may be appropriate, dependent on the editorial philosophy of the project.

Example

The story I am going to relate is true as to its main facts, and as to the consequences <add place="above">of these facts</add> from which this tale takes its title.
Content model

character data
Note Addresses may be encoded either as a sequence of lines, or using any sequence of component elements from the model.addrPart class. Other non-postal forms of address, such as telephone numbers or email, should not be included within an <address> element directly but may be wrapped within an <addrLine> if they form part of the printed address in some source text.

Example

```
<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL</addrLine>
  <addrLine>60680 USA</addrLine>
</address>
```

Example

```
<addrLine>
  <ref target="tel:+1-201-555-0123">(201) 555 0123</ref>
</addrLine>
```

Content model

```

May contain core: addrLine cb gap lb milestone name note pb rs
figures: figure
header: idno
linking: anchor
transcr: fw

Note This element should be used for postal addresses only. Within it, the generic element <addrLine> may be used as an alternative to any of the more specialized elements available from the model.addrPart class, such as <street>, <postcode> etc.

Example Using just the elements defined by the core module, an address could be represented as follows:

```xml
<address>
  <street>via Marsala 24</street>
  <postcode>40126</postcode>
  <name>Bologna</name>
  <name>Italy</name>
</address>
```

Example When a schema includes the names and dates module more specific elements such as country or settlement would be preferable over generic <name>:

```xml
<address>
  <street>via Marsala 24</street>
  <postcode>40126</postcode>
  <settlement>Bologna</settlement>
  <country>Italy</country>
</address>
```

Example

```xml
<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL 60680</addrLine>
  <addrLine>USA</addrLine>
</address>
```

Example

```xml
<address>
  <country key="FR"/>
  <settlement type="city">Lyon</settlement>
  <postcode>69002</postcode>
  <district type="arrondissement">IIème</district>
  <district type="quartier">Perrache</district>
</address>
```
Content model

Note Particularly where cataloguing is likely to be based on the content of the header, it
is advisable to use a generally recognized name authority file to supply the content
for this element. The attributes key or ref may also be used to reference canonical
information about the author(s) intended from any appropriate authority, such as a
library catalogue or online resource.

In the case of a broadcast, use this element for the name of the company or network
responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as
Unknown or Anonymous. When the appropriate TEI modules are in use, it may also
contain detailed tagging of the names used for people, organizations or places, in
particular where multiple names are given.

Example

  <author>British Broadcasting Corporation</author>
  <author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de
(1634–1693)</author>
  <author>Anonymous</author>
  <author>Bill and Melinda Gates Foundation</author>
  <author>
    <persName>Beaumont, Francis</persName> and
    <persName>John Fletcher</persName>
  </author>
  <author>
    <orgName key="BBC">British Broadcasting
Corporation</orgName>: Radio 3 Network
  </author>

Content model

  <content>
    <macroRef key="macro.phraseSeq"/>
  </content>
<availability>

</content>

Schema Declaration

```xml
<availability>
  
<model predicate="ancestor::teiHeader"
  behaviour="omit"/>
  
<model behaviour="inline"/>
</availability>
```

Processing Model

```xml
<availability>
  
<model predicate="ancestor::teiHeader"
  behaviour="omit"/>
  
<model behaviour="inline"/>
</availability>
```

<availability> supplies information about the availability of a text, for example any restrictions on its use or distribution, its copyright status, any licence applying to it, etc. [2.2.4. Publication, Distribution, Licensing, etc.]

**Module** header

**<biblScope>** (scope of bibliographic reference) defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work. [3.11.2.5. Scopes and Ranges in Bibliographic Citations]

**Module** core

**Attributes**

- att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
- (att.global.rendition (@rendition))
- (att.global.linking (@corresp, @next, @prev))
- (att.global.analytic (@ana))
- (att.global.facsimile (@facs))
- (att.global.responsibility (@cert, @resp))
- (att.global.source (@source))
- att.citing (@unit, @from, @to)

**Member of** model.imprintPart
Note When a single page is being cited, use the from and to attributes with an identical value. When no clear endpoint is provided, the from attribute may be used without to; for example a citation such as p. 3ff might be encoded <biblScope from="3">p. 3ff</biblScope>.

It is now considered good practice to supply this element as a sibling (rather than a child) of <imprint>, since it supplies information which does not constitute part of the imprint.

Example

```xml
<biblScope>pp 12–34</biblScope>
<biblScope unit="page" from="12" to="34"/>
<biblScope unit="volume">II</biblScope>
<biblScope unit="page">12</biblScope>
```

Content model

```xml
<content>

corpus data

Note The byline on a title page may include either the name or a description for the
document's author. Where the name is included, it may optionally be tagged using the
<docAuthor> element.

Example

<byline>Written by a CITIZEN who continued all the
while in London. Never made publick before.</byline>

Example

<byline>Written from her own MEMORANDUMS</byline>

Example

<byline>By George Jones, Political Editor, in Washington</byline>

Example

<byline>BY
<docAuthor>THOMAS PHILIPOTT,
Master of Arts,
(Somtimes)
Of Clare-Hall in Cambridge.</byline>

drama: castGroup castItem roleDesc

figures: figure

linking: anchor

textstructure: trailer

Note

The `rend` attribute may be used, as here, to indicate whether the grouping is indicated by a brace, whitespace, font change, etc.

Note that in this example the role description friends of Mathias is understood to apply to both roles equally.

Example

```xml
<castGroup rend="braced">
  <castItem>
    <role>Walter</role>
    <actor>Mr Frank Hall</actor>
  </castItem>
  <castItem>
    <role>Hans</role>
    <actor>Mr F.W. Irish</actor>
  </castItem>
  <roleDesc>friends of Mathias</roleDesc>
</castGroup>
```

Content model

```xml
<content>
  <sequence minOccurs="1" maxOccurs="1">
    <alternate minOccurs="0" maxOccurs="unbounded">
      <classRef key="model.global"/>
      <classRef key="model.headLike"/>
    </alternate>
    <sequence minOccurs="1" maxOccurs="unbounded">
      <alternate minOccurs="1" maxOccurs="1">
        <elementRef key="castItem"/>
        <elementRef key="castGroup"/>
        <elementRef key="roleDesc"/>
      </alternate>
      <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
    <sequence minOccurs="0" maxOccurs="1">
      <elementRef key="trailer"/>
      <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
  </sequence>
</content>
```
Schema Declaration

```
element castGroup
{
    att.global.attributes,
    (  ( model.global | model.headLike )*,
        ( ( castItem | castGroup | roleDesc ), model.global* )+,           
        ( trailer, model.global* )?
    )
}
```

Processing Model

```
<model predicate="child::*" behaviour="list">
<desc>Insert list. </desc>
</model>
```

<castItem> (cast list item) contains a single entry within a cast list, describing either a
single role or a list of non-speaking roles. [7.1.4. Cast Lists]

Module drama

Attributes

```
att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)

May contain Empty element
Note On this element, the global \( n \) attribute indicates the number or other value associated with the column which follows the point of insertion of this \(<\text{cb}>\) element. Encoders should adopt a clear and consistent policy as to whether the numbers associated with column breaks relate to the physical sequence number of the column in the whole text, or whether columns are numbered within the page.

The \(<\text{cb}>\) element is placed at the head of the column to which it refers.

Example Markup of an early English dictionary printed in two columns:

```
<entryFree>
    <form>Well</form>, <sense>a Pit to hold Spring-Water</sense>:<sense>
        In the Art of <hi rend="italic">War</hi>, a Depth the Miner
        sinks into the Ground, to find out and disappoint the Enemies Mines,
        or to prepare one</sense>.
    </entryFree>

<entryFree>
    To <form>Welter</form>, <sense>to wallow</sense>, or
    <sense>lie groveling</sense>.</entryFree>

<entryFree>
    <form>Wey</form>, <sense>the greatest Measure for dry Things,
    containing five Chaldron</sense>.
</entryFree>

<entryFree>
    <form>Whale</form>, <sense>the greatest of
    Sea-Fishes</sense>.
</entryFree>
```

  <sequence>
    <elementRef key="desc" minOccurs="0"/>
    <alternate minOccurs="1" maxOccurs="unbounded">
      <elementRef key="char"/>
      <elementRef key="glyph"/>
    </alternate>
  </sequence>
</content>
\end{verbatim}

Schema Declaration

\texttt{element charDecl \{ att.global.attributes, ( desc?, ( char | glyph )+ ) \}}

\texttt{<charName>\textit{\{character name\}} contains the name of a character, expressed following Unicode conventions. [5.2. Markup Constructs for Representation of Characters and Glyphs]}

\texttt{Deprecated} will be removed on 2022-02-15

Module gaiji

Attributes

\begin{verbatim}
att.global ( @xml:id, @n, @xml:lang, @xml:base, @xml:space)
  (att.global.rendition ( @rendition)) (att.global.linking ( @corresp, @next, @prev))
  (att.global.analytic ( @ana)) (att.global.facs ( @facs)) (att.global.responsibility
    ( @cert, @resp)) (att.global.source ( @source))
\end{verbatim}

Contained by

\texttt{gaiji: char}

May contain Character data only

Note The name must follow Unicode conventions for character naming. Projects working in similar fields are recommended to coordinate and publish their list of \texttt{<charName>\textit{s}} to facilitate data exchange.

Example

\begin{verbatim}
<charName>CIRCLED IDEOGRAPH 4EBA</charName>
\end{verbatim}

Content model \texttt{<content> <textNode/>\texttt{</content>}}
Schema Declaration

```xml
<choice>
  <element charName { att.global.attributes, text }
```

Note: Because the children of a `<choice>` element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel.

Note also that `<choice>` elements may self-nest.

Where the purpose of an encoding is to record multiple witnesses of a single work, rather than to identify multiple possible encoding decisions at a given point, the `<app>` element and associated elements discussed in section 12.1. The Apparatus Entry, Readings, and Witnesses should be preferred.

Example: An American encoding of *Gulliver’s Travels* which retains the British spelling but also provides a version regularized to American spelling might be encoded as follows.

```xml
<p>Lastly, That, upon his solemn oath to observe all the above articles, the said man-mountain shall have a daily allowance of meat and drink sufficient for the support of <choice>
  <sic>1724</sic>
  <corr>1728</corr>
</choice> of our subjects,
with free access to our royal person, and other marks of our</p>
```
<choice> 

<orig>favour</orig> 
<reg>favor</reg> 
</choice>.

Schematron `<s:assert test="count(*) > 1" role="ERROR"> Element "<s:name/>" must have at least two child elements.</s:assert> 

Schematron `<s:assert test="(tei:corr or tei:sic or tei:expan or tei:abbr or tei:reg or tei:orig) and ((tei:corr and tei:sic) or (tei:expan and tei:abbr) or (tei:reg and tei:orig))" role="ERROR"> Element "<s:name/>" must have corresponding corr/sic, expand/abbr, reg/orig </s:assert>

character data
The `<creation>` element may be used to record details of a text’s creation, e.g. the date and place it was composed, if these are of interest. It may also contain a more structured account of the various stages or revisions associated with the evolution of a text; this should be encoded using the `<listChange>` element. It should not be confused with the `<publicationStmt>` element, which records date and place of publication.

Example

```xml
<creation>
  <date>Before 1987</date>
</creation>
```

Example

```xml
<creation>
  <date when="1988-07-10">10 July 1988</date>
</creation>
```

character data

Note This element should be used for deletion of shorter sequences of text, typically single words or phrases. The <delSpan> element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.

The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a <supplied> tag). Illegible or lost text within a deletion may be marked using the <gap> tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the <gap> element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the <unclear> element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way.

Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the <certainty> element (see 21. Certainty, Precision, and Responsibility).

There is a clear distinction in the TEI between <del> and <surplus> on the one hand and <gap> or <unclear> on the other. <del> indicates a deletion present in
the source being transcribed, which states the author’s or a later scribe’s intent to cancel or remove text. `<surplus>` indicates material present in the source being transcribed which should have been so deleted, but which is not in fact. `<gap>` or `<unclear>`, by contrast, signal an editor’s or encoder’s decision to omit something or their inability to read the source text. See sections 11.3.1.7. Text Omitted from or Supplied in the Transcription and 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for the relationship between these and other related elements used in detailed transcription.

Example

```xml
<l>
  <del rend="overtyped">Mein</del> Frisch
  <del rend="overstrike" type="primary">schwebt</del>
  weht der Wind
</l>
```

Example

```xml
<del rend="overstrike">
  <gap reason="illegible" quantity="5" unit="character"/>
</del>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
element del
{
  att.global.attributes,
  att.transcriptional.attributes,
  att.typed.attributes,
  att.dimensions.attributes,
  macro.paraContent
}
```

Processing Model

```xml
<model behaviour="inline">
  <outputRendition> text-decoration: line-through;</outputRendition>
</model>
```
@type characterizes the element in some sense, using any convenient
classification scheme or typology.

Derived from att.typed

fw
Fallacies of Authority

The subject of which is Authority in various shapes, and the object, to repress all exercise of the reasoning faculty.

The Nature of Authority

With reference to any proposed measures having for their object the greatest happiness of the greatest number [...] 

Analysis of Authority

What on any given occasion is the legitimate weight or influence to be attached to authority [...] 

Appeal to Authority, in What Cases Fallacious.

Reference to authority is open to the charge of fallacy when [...]
<docAuthor> (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline). [4.6. Title Pages]

Module textstructure

Attributes  
att.global  (@xml:id, @n, @xml:lang, @xml:base, @xml:space)  
att.global.rendition (@rendition)  
att.global.linking (@corresp, @next, @prev)
The document author’s name often occurs within a byline, but the `<docAuthor>` element may be used whether the `<byline>` element is used or not. It should be used only for the author(s) of the entire document, not for author(s) of any subset or part of it. (Attributions of authorship of a subset or part of the document, for example of a chapter in a textbook or an article in a newspaper, may be encoded with `<byline>` without `<docAuthor>`.)

**Example**

```xml
<titlePage>
  <docTitle>
  <titlePart>Travels into Several Remote Nations of the World, in Four Parts.</titlePart>
  </docTitle>
  <byline>By <docAuthor>Lemuel Gulliver</docAuthor>, First a Surgeon, and then a Captain of several Ships</byline>
</titlePage>
```

**Content model**

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

**Schema Declaration**

```xml
element docAuthor
{
  att.global.attributes,
  att.canonical.attributes,
  macro.phraseSeq
}
<docDate> (document date) contains the date of a document, as given on a title page or in a dateline. [4.6. Title Pages]

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))

@when gives the value of the date in standard form, i.e. YYYY-MM-DD.

Status Optional

Datatype teidata.temporal.w3c

Note For simple dates, the when attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in XML Schema Part 2: Datatypes Second Edition.

EEBO-TCP is a partnership between the Universities of Michigan and Oxford and the publisher ProQuest to create accurately transcribed and encoded texts based on the image sets published by ProQuest via their Early English Books Online (EEBO) database (http://eebo.chadwyck.com). The general aim of EEBO-TCP is to encode one copy (usually the first edition) of every monographic English-language title published between 1473 and 1700 available in EEBO.

EEBO-TCP aimed to produce large quantities of textual data within the usual project restraints of time and funding, and therefore chose to create diplomatic transcriptions (as opposed to critical editions) with light-touch, mainly structural encoding based on the Text Encoding Initiative (http://www.tei-c.org).

The EEBO-TCP project was divided into two phases. The 25,363 texts created during Phase 1 of the project have been released into the public domain as of 1 January 2015. Anyone can now take and use these texts for their own purposes, but we respectfully request that due credit and attribution is given to their original source.

Users should be aware of the process of creating the TCP texts, and therefore of any assumptions that can be made about the data.

Text selection was based on the New Cambridge Bibliography of English Literature (NCBEL). If an author (or for an anonymous work, the title) appears in NCBEL, then their works are eligible for inclusion. Selection was intended to range over a wide variety of subject areas, to reflect the true nature of the print record of the period. In general, first editions of a works in English were prioritized, although there are a number of works in other languages, notably Latin and Welsh, included and sometimes a second or later edition of a work was chosen if there was a compelling reason to do so.

Image sets were sent to external keying companies for transcription and basic encoding. Quality assurance was then carried out by editorial teams in Oxford and Michigan. 5% (or 5 pages, whichever is the greater) of each text was proofread for accuracy and those which did not meet QA standards were returned to the keyers to be redone. After proofreading, the encoding was enhanced and/or corrected and characters marked as illegible were corrected where possible up to a limit of 100 instances per text. Any remaining illegibles were encoded as <gap>s. Understanding
these processes should make clear that, while the overall quality of TCP data is very good, some errors will remain and some readable characters will be marked as illegible. Users should bear in mind that in all likelihood such instances will never have been looked at by a TCP editor.

The texts were encoded and linked to page images in accordance with level 4 of the TEI in Libraries guidelines. Copies of the texts have been issued variously as SGML (TCP schema; ASCII text with mnemonic sdata character entities); displayable XML (TCP schema; characters represented either as UTF-8 Unicode or text strings within braces); or lossless XML (TEI P5, characters represented either as UTF-8 Unicode or TEI g elements).

Keying and markup guidelines are available at the Text Creation Partnership web site.

Member of model.choicePart model.pPart.editorial
Contained by analysis: p s w
The content of this element should be the expanded abbreviation, usually (but not always) a complete word or phrase. The <ex> element provided by the transc module may be used to mark up sequences of letters supplied within such an expansion.

If abbreviations are expanded silently, this practice should be documented in the <editorialDecl>, either with a <normalization> element or a <p>.

Example

The address is Southmoor
<choice>
  <expan>Road</expan>
  <abbr>Rd</abbr>
</choice>

Example

<choice xml:lang="la">
  <abbr>Imp</abbr> <ex>erator</ex>
</choice>

verse: rhyme
character data

Note The global xml:lang attribute should be supplied for this element to identify the
language of the word or phrase marked. As elsewhere, its value should be a language
tag as defined in 6.1. Language Identification.
This element is intended for use only where no other element is available to mark the
phrase or words concerned. The global xml:lang attribute should be used in
preference to this element where it is intended to mark the language of the whole of
some text element.
The <distinct> element may be used to identify phrases belonging to
sublanguages or registers not generally regarded as true languages.

Example
This is
heathen Greek to you still? Your <foreign xml:lang="la">lapis
philosophicus</foreign>?

Because cultural conventions differ as to which elements are grouped as front matter and which as back matter, the content models for the <front> and <back> elements are identical.

Example

<front>
<epigraph>
<quote>Nam Sibyllam quidem Cumis ego ipse oculis meis vidi in ampulla pendere, et cum illi pueri dicerent: <q xml:lang="grc">Σίβυλλα τί θέλεις</q>; respondebat illa: <q xml:lang="grc">ἀποθεοῦνεις θέλω.</q>
</quote>
</epigraph>
<div type="dedication">
<p>For Ezra Pound <q xml:lang="it">il miglior fabbro.</q></p>
</div>
</front>
Example

<front>
  <div type="dedication">
    <p>To our three selves</p>
  </div>
  <div type="preface">
    <head>Author's Note</head>
    <p>All the characters in this book are purely imaginary, and if the author has used names that may suggest a reference to living persons she has done so inadvertently. ...</p>
  </div>
</front>

Example

<front>
  <div type="abstract">
    <head> BACKGROUND:</head>
    <p>Food insecurity can put children at greater risk of obesity because of altered food choices and nonuniform consumption patterns.</p>
  </div>
  <head> OBJECTIVE:</head>
  <p>We examined the association between obesity and both child-level food insecurity and personal food insecurity in US children.</p>
  <head> DESIGN:</head>
  <p>Data from 9,701 participants in the National Health and Nutrition Examination Survey, 2001-2010, aged 2 to 11 years were analyzed. Child-level food insecurity was assessed with the US Department of Agriculture's Food Security Survey Module based on eight child-specific questions. Personal food insecurity was assessed with five additional questions. Obesity was defined, using physical measurements, as body mass index (calculated as kg/m²) greater than or equal to the age- and sex-specific 95th percentile of the Centers for Disease Control and Prevention growth charts. Logistic regressions adjusted for sex, race/ethnic group, poverty level, and survey year were conducted to describe associations between obesity and food insecurity.</p>
  <head> RESULTS:</head>
  <p>Obesity was significantly associated with personal food insecurity for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to 2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95% CI 0.51 to 1.51). Child-level food insecurity was not associated with obesity among 2- to 5-year-olds or 6- to 11-year-olds.</p>
  <head> CONCLUSIONS:</head>
  <p>Personal food insecurity is associated with an increased risk of obesity only in children aged 6 to 11 years. Personal food-insecurity measures may give different results than aggregate food-insecurity measures in children.</p>

correction

Note Where running heads are consistent throughout a chapter or section, it is usually
more convenient to relate them to the chapter or section, e.g. by use of the rend
attribute. The <fw> element is intended for cases where the running head changes
from page to page, or where details of page layout and the internal structure of the
running heads are of paramount importance.

Example

<fw type="sig" place="bottom">C3</fw>

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml

May contain Character data only

Note The name g is short for gaiji, which is the Japanese term for a non-standardized character or glyph.

Example

```
<g ref="#ctlig">ct</g>
```

This example points to a `<glyph>` element with the identifier `ctlig` like the following:

```
<glyph xml:id="ctlig">
<!-- here we describe the particular ct-ligature intended -->
</glyph>
```

Example

```
<g ref="#per-glyph">per</g>
```

The medieval brevigraph per could similarly be considered as an individual glyph, defined in a `<glyph>` element with the identifier `per-glyph` as follows:

```
<glyph xml:id="per-glyph">
<!-- ... -->
</glyph>
```
<gap> indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible. [3.4.3. Additions, Deletions, and Omissions]

May contain
The `<gap>`, `<unclear>`, and `<del>` core tag elements may be closely allied in use with the `<damage>` and `<supplied>` elements, available when using the additional tagset for transcription of primary sources. See section 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The `<gap>` tag simply signals the editor’s decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that text was deliberately erased or covered, should be indicated using the relevant tags, such as `<del>` in the case of deliberate deletion.

**Example**

```
<gap quantity="4" unit="chars" reason="illegible"/>
```

**Example**

```
<gap quantity="1" unit="essay" reason="sampling"/>
```

=head>

(heading) contains any type of heading, for example the title of a section, or the heading of a list, glossary, manuscript description, etc. [4.2.1. Headings and Trailers]

Module core

Attributes

att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
Note The `<head>` element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a `<head>` element based on its structural position. A `<head>` occurring as the first element of a list is the title of that list; one occurring as the first element of a `<div1>` is the title of that chapter or section.

Example The most common use for the `<head>` element is to mark the headings of sections. In older writings, the headings or *incipits* may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a `<trailer>`, as in this example:

```xml
<div n="I" type="book">
  <head>In the name of Christ here begins the first book of the ecclesiastical history of Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
  <div2 type="section">
    <head>In the name of Christ here begins Book I of the history.</head>
    <p>Proposing as I do ...</p>
    <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p>
    <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer>
  </div2>
</div>
```
Example: When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the place attribute.

Example: The head element is also used to mark headings of other units, such as lists:

With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. <list rend="bulleted">
  <head>Connectives</head>
  <item>above</item>
  <item>accordingly</item>
  <item>across from</item>
  <item>adjacent to</item>
  <item>again</item>
</list>

⟨idno⟩ (identifier) supplies any form of identifier used to identify some object, such as a bibliographic item, a person, a title, an organization, etc. in a standardized way.

[13.3.1. Basic Principles 2.2.4. Publication, Distribution, Licensing, etc. 2.2.5. The Series Statement 3.11.2.4. Imprint, Size of a Document, and Reprint Information]

Module header
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
att.global.rendition (@rendition)) att.global.linking (@corresp, @next, @prev)
@type categorizes the identifier, for example as an ISBN, Social Security number, etc.

**Derived from** att.typed

**Status** Optional

**Datatype** teidata.enumerated

**Suggested values include:**

- **ISBN** International Standard Book Number: a 13- or (if assigned prior to 2007) 10-digit identifying number assigned by the publishing industry to a published book or similar item, registered with the International ISBN Agency.

- **ISSN** International Standard Serial Number: an eight-digit number to uniquely identify a serial publication.

- **DOI** Digital Object Identifier: a unique string of letters and numbers assigned to an electronic document.

- **URI** Uniform Resource Identifier: a string of characters to uniquely identify a resource which usually contains indication of the means of accessing that resource, the name of its host, and its filepath.

- **VIAF** A data number in the Virtual Internet Authority File assigned to link different names in catalogs around the world for the same entity.

- **ESTC** English Short-Title Catalogue number: an identifying number assigned to a document in English printed in the British Isles or North America before 1801.

- **OCLC** OCLC control number (record number) for the union catalog record in WorldCat, a union catalog for member libraries in the Online Computer Library Center global cooperative.
character data

Note <idno> should be used for labels which identify an object or concept in a formal cataloguing system such as a database or an RDF store, or in a distributed system such as the World Wide Web. Some suggested values for type on <idno> are ISBN, ISSN, DOI, and URI.

Example

```xml
<html xmlns="http://www.w3.org/1999/xhtml"
xmlns:idno="http://www.loc.gov/standards/cataloging/idno"
xmlns:metadata="http://www.loc.gov/standards/metadata">
  <idno type="ISBN">978-1-906964-22-1</idno>
  <idno type="ISSN">0143-3385</idno>
  <idno type="DOI">10.1000/123</idno>
  <idno type="URI">http://www.worldcat.org/oclc/185922478</idno>
  <idno type="URI">http://authority.nzetc.org/463</idno>
  <idno type="LT">Thomason Tract E.537(17)</idno>
  <idno type="Wing">C695</idno>
  <idno type="oldCat">
    <g ref="#sym">345</g>
  </idno>
</html>
```

In the last case, the identifier includes a non-Unicode character which is defined elsewhere by means of a <glyph> or <char> element referenced here as #sym.

Content model

character data
Note May contain simple prose or a sequence of chunks.

Whatever string of characters is used to label a list item in the copy text may be
used as the value of the global n attribute, but it is not required that numbering be
recorded explicitly. In ordered lists, the n attribute on the <item> element is by
definition synonymous with the use of the <label> element to record the enumerator
of the list item. In glossary lists, however, the term being defined should be given
with the <label> element, not n.

Example

<list rend="numbered">
<head>Here begin the chapter headings of Book IV</head>
<item n="4.1">The death of Queen Clotild.</item>
<item n="4.2">How King Lothar wanted to appropriate one third of the
Church revenues.</item>
<item n="4.3">The wives and children of Lothar.</item>
<item n="4.4">The Counts of the Bretons.</item>
<item n="4.5">Saint Gall the Bishop.</item>
<item n="4.6">The priest Cato.</item>
<item>...<item>
</list>

Content model

<content>
<macroRef key="macro.specialPara"/>
</content>

Schema Declaration

element item
{
att.global.attributes,
att.sortable.attributes,
macro.specialPara}

Processing Model <model behaviour="listItem"/>

<keywords> contains a list of keywords or phrases identifying the topic or nature of a
text. [2.4.3. The Text Classification]
Module header
Attributes

\( \text{att.global} (\@xml:id, \@n, \@xml:lang, \@xml:base, \@xml:space) \)
\( \text{att.global.rendition} (\@rendition) \)
\( \text{att.global.linking} (\@corresp, \@next, \@prev) \)
\( \text{att.global.analytic} (\@ana) \)
\( \text{att.global.facs} (\@facs) \)
\( \text{att.global.responsibility} (\@cert, \@resp) \)
\( \text{att.global.source} (\@source) \)

@scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a \(<\text{taxonomy}>\) element, or by some other resource.

Status Optional

Datatype teidata.pointer

Contained by: textClass

May contain:

core: list

term

Note

Each individual keyword (including compound subject headings) should be supplied as a \(<\text{term}>\) element directly within the \(<\text{keywords}>\) element. An alternative usage, in which each \(<\text{term}>\) appears within a \(<\text{item}>\) inside a \(<\text{list}>\) is permitted for backwards compatibility, but is deprecated.

If no control list exists for the keywords used, then no value should be supplied for the scheme attribute.

Example

\[
<\text{keywords} \text{scheme="http://classificationweb.net"}>
  <\text{term}>Babbage, Charles</\text{term}>
  <\text{term}>Mathematicians - Great Britain - Biography</\text{term}>
</\text{keywords}>
\]

Example

\[
<\text{keywords}>
  <\text{term}>Fermented beverages</\text{term}>
  <\text{term}>Central Andes</\text{term}>
  <\text{term}>Schinus molle</\text{term}>
  <\text{term}>Molle beer</\text{term}>
  <\text{term}>Indigenous peoples</\text{term}>
  <\text{term}>Ethnography</\text{term}>
  <\text{term}>Archaeology</\text{term}>
</\text{keywords}>
\]

Content model

\[

**Example**

Labels are commonly used for the headwords in glossary lists; note the use of the global `xml:lang` attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:

```xml
<list type="gloss" xml:lang="enm">
  <head xml:lang="en">Vocabulary</head>
  <headLabel xml:lang="en">Middle English</headLabel>
  <headItem xml:lang="en">New English</headItem>
  <label>nu</label>
  <item xml:lang="en">now</item>
  <label>lhude</label>
  <item xml:lang="en">loudly</item>
  <label>bloweth</label>
  <item xml:lang="en">blooms</item>
  <label>med</label>
  <item xml:lang="en">meadow</item>
  <label>wude</label>
  <item xml:lang="en">wood</item>
  <label>awe</label>
  <item xml:lang="en">ewe</item>
  <label>lhouth</label>
  <item xml:lang="en">lows</item>
  <label>sterteth</label>
  <item xml:lang="en">bounds, frisks (cf. <cit>
    <ref>Chaucer, K.T.644</ref>
    <quote>a courser, <term>sterting</term> as the fyr</quote>
  </cit>
</item>
</label>
</list>
```

**Example**

Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's *Autobiography*. In this usage the `<label>` element is synonymous with the `n` attribute on the `<item>` element:
I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos.

Example Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

Example Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the `<label>` element appears within the `<p>` or `<lg>` element, rather than as a preceding sibling of it.

In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the `type` attribute may be used to distinguish different categories of label.

verse: rhyme

May contain Empty element

Note By convention, <lb> elements should appear at the point in the text where a new line starts. The n attribute, if used, indicates the number or other value associated with the text between this point and the next <lb> element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the <l> element is available) except in circumstances where structural units cannot otherwise be marked.

The type attribute may be used to characterize the line break in any respect. The more specialized attributes break, ed, or edRef should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

Example This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```xml
<l>Of Mans First Disobedience, <lb ed="1674"/> and <lb ed="1667"/> the Fruit</l>
<l>Of that Forbidden Tree, whose <lb ed="1667 1674"/> mortal tast</l>
<l>Brought Death into the World, <lb ed="1667"/> and all <lb ed="1674"/> our woe, </l>
```

Example This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The break attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.
<titlePart>
  <lb/>With Additions, ne-<lb break="no"/>ver before Printed.
</titlePart>

```
element licence
{ 
  att.global.attributes, 
  att.pointing.attributes, 
  att.datable.attributes, 
  macro.specialPara}
```

<list> contains any sequence of items organized as a list. [3.7. Lists]

Module core

Attributes

- `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@xml:base`, `@xml:space`)
- `att.global.rendition` (`@rendition`)
- `att.global.linking` (`@corresp`, `@next`, `@prev`)
- `att.global.analytic` (`@ana`)
- `att.global.facs` (`@facs`)
- `att.global.responsibility` (`@cert`, `@resp`)
- `att.global.source` (`@source`)
- `att.sortable` (`@sortKey`)
- `att.typed` (`type`, `@subtype`)

`@type` describes the nature of the items in the list.

- Derived from `att.typed`
- Status Optional
- Datatype `teidata.enumerated`

Suggested values include:

- `gloss` each list item glosses some term or concept, which is given by a `<label>` element preceding the list item.
- `index` each list item is an entry in an index such as the alphabetical topical index at the back of a print volume.
- `instructions` each list item is a step in a sequence of instructions, as in a recipe.
- `litany` each list item is one of a sequence of petitions, supplications or invocations, typically in a religious ritual.
syllogism each list item is part of an argument consisting of two or more propositions and a final conclusion derived from them.

Note Previous versions of these Guidelines recommended the use of type on <list> to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the rend or style attributes for these aspects of a list, while using type for the more appropriate task of characterizing the nature of the content of a list.

The formal syntax of the element declarations allows <label> tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.

postscript salute signed trailer
transcr: fw

Note May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.

Example

```xml
<list rend="numbered">
  <item>a butcher</item>
  <item>a baker</item>
  <item>a candlestick maker, with
      <list rend="bulleted">
        <item>rings on his fingers</item>
        <item>bells on his toes</item>
      </list>
</list>
```

Example

```xml
<list type="syllogism" rend="bulleted">
  <item>All Cretans are liars.</item>
  <item>Epimenides is a Cretan.</item>
  <item>ERGO Epimenides is a liar.</item>
</list>
```
Example

<list type="litany" rend="simple">
  <item>God save us from drought.</item>
  <item>God save us from pestilence.</item>
  <item>God save us from wickedness in high places.</item>
  <item>Praise be to God.</item>
</list>

Example The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):

<div type="section">
  <head>Athelstan's Ordinance</head>
  <list rend="numbered">
    <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with the stolen goods, [if he is] over twelve years and [if the value of the goods is] over eightpence. And if anyone does spare one, he is to pay for the thief with his wergild — and the thief is to be no nearer a settlement on that account — or to clear himself by an oath of that amount. If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve]. If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever. And if he steals after that, they are to pay for him with his wergild, or to bring him back there. And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a fine.
    </item>
    <item n="2">Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting. If they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him down as a thief. And he who harbours him after that, is to pay for him with his wergild or to clear himself by an oath of that amount.
    </item>
    <item n="3">Concerning the refusal of justice. The lord who refuses
  </item>
</list>
justice and upholds his guilty man, so that the king is appealed to, is to repay the value of the goods and 120 shillings to the king; and he who appeals to the king before he demands justice as often as he ought, is to pay the same fine as the other would have done, if he had refused him justice.

<list rend="numbered"
  <item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes known about him, is to forfeit the slave and be liable to his wergild on the first occasion if he does it more often, he is to be liable to pay all that he owns.</item>
  <item n="3.2">And likewise any of the king's treasurers or of our reeves, who has been an accessory of thieves who have committed theft, is to liable to the same.</item>
</list>

Concerning treachery to a lord. And we have pronounced concerning treachery to a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is afterwards convicted at the three-fold ordeal.

Example

<p>These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross.

<list rend="simple"
  <item>I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.</item>
  <item>I, Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.</item>
  <item>I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.</item>
  <item>I, Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.</item>
  <item>I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.</item>
  <item>I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.</item>
</p>
I, Æthelwine, bishop, have subscribed through delegates.

I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.

<listChange> groups a number of change descriptions associated with either the creation of a source text or the revision of an encoded text.

Module header
Attributes

@ordered indicates whether the ordering of its child <change> elements is to be considered significant or not.
Status Optional
Datatype teidata.truthValue
Default true

Contained by: creation listChange revisionDesc
May contain: core: desc
header: change listChange

Note:
When this element appears within the <creation> element it documents the set of revision campaigns or stages identified during the evolution of the original text.
When it appears within the <revisionDesc> element, it documents only changes made during the evolution of the encoded representation of that text.

Example

<revisionDesc>
 <listChange>
   <change when="1991-11-11" who="#LB"> deleted chapter 10 </change>
   <change when="1991-11-02" who="#MSM"> completed first draft </change>
 </listChange>
</revisionDesc>

Example

<profileDesc>
 <creation>
   <listChange ordered="true">
     <change xml:id="CHG-1">First stage, written in ink by a writer</change>
     <change xml:id="CHG-2">Second stage, written in Goethe’s hand using pencil</change>
     <change xml:id="CHG-3">Fixation of the revised passages and further revisions by Goethe using ink</change>
     <change xml:id="CHG-4">Addition of another stanza in a different hand, probably at a later stage</change>
   </listChange>
 </creation>
</profileDesc>

May contain Empty element

Note For this element, the global n attribute indicates the new number or other value for the unit which changes at this milestone. The special value unnumbered should be used in passages which fall outside the normal numbering scheme, such as chapter or other headings, poem numbers or titles, etc.

The order in which <milestone> elements are given at a given point is not normally significant.

Example

```xml
<milestone n="23" ed="La" unit="Dreissiger"/>
... <milestone n="24" ed="AV" unit="verse"/>
```

Content model `<content> <empty/></content>`

Schema Declaration

```xml
element milestone
{
    att.global.attributes,
    att.milestoneUnit.attributes,
    att.typed.attributes,
    att.edition.attributes,
    att.spanning.attributes,
    att.breaking.attributes,
    empty
}
```

Processing Model `<model behaviour="inline"/>`

@anchored indicates whether the copy text shows the exact place of reference for the note.

Status: Optional

Datatype: teidata.truthValue

Default: true

Note: In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. page 218, lines 3–4). The anchored attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an explicit location is indicated in the copy text; the value false indicates that the copy text does not indicate a specific place of attachment for the note. If the specific symbols
used in the copy text at the location the note is anchored are to be
recorded, use the \( n \) attribute.

@targetEnd points to the end of the span to which the note is attached, if the
note is not embedded in the text at that point.

**Status** Optional

**Datatype** \( 1--\infty \) occurrences of `teidata.pointer` separated by whitespace

**Note** This attribute is retained for backwards compatibility; it may be
removed at a subsequent release of the Guidelines. The
recommended way of pointing to a span of elements is by means of
the `range()` function of XPointer, as further described in [16.2.4.6].

**Example** In the following example, the translator has supplied a footnote containing an
explanation of the term translated as "painterly":

```
In the following example, the translator has supplied a footnote containing an
explanation of the term translated as "painterly":
```
And yet it is not only
in the great line of Italian renaissance art, but even in the painterly <note place="bottom" type="gloss" resp="#MDMH"> <term xml:lang="de">Malerisch</term>. This word has, in the German, two distinct meanings, one objective, a quality residing in the object, the other subjective, a mode of apprehension and creation. To avoid confusion, they have been distinguished in English as <mentioned>picturesque</mentioned> and <mentioned>painterly</mentioned> respectively.
</note> style of the Dutch genre painters of the seventeenth century that drapery has this psychological significance.

<!-- elsewhere in the document -->
<respStmt xml:id="MDMH">
<resp>translation from German to English</resp>
<name>Hottinger, Marie Donald Mackie</name>
</respStmt>

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example The global n attribute may be used to supply the symbol or number used to mark the note’s point of attachment in the source text, as in the following example:

Mevorakh b. Saadya’s mother, the matriarch of the family during the second half of the eleventh century, <note n="126" anchored="true"> The alleged mention of Judah Nagid’s mother in a letter from 1071 is, in fact, a reference to Judah’s children; cf. above, nn. 111 and 54. </note> is well known from Geniza documents published by Jacob Mann.

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

Content model

```
<content>
  <macroRef key="macro.specialPara"/>
</content>
```

Schema Declaration

```
element note
  { 
    att.global.attributes,
    att.placement.attributes,
    att.pointing.attributes,
    att.typed.attributes,
    att.written.attributes,
    attribute anchored { text }?,
    attribute targetEnd { list { + } }?,
    macro.specialPara}
```

Processing Model
<notesStmt> (notes statement) collects together any notes providing information
about a text additional to that recorded in other parts of the bibliographic
description. [2.2.6. The Notes Statement 2.2. The File Description]

Module header
Attributes Attributes att.global (@xml:id, @a, @xml:lang, @xml:base, @xml:space)
(att.global rendition (@rendition)) (att.global linking (@corresp, @next, @prev))
(att.global analytic (@ana)) (att.global facets (@facs)) (att.global responsibility
(@cert, @resp)) (att.global source (@source))

Contained by
header: biblFull fileDesc
May contain relatedItem

Note Information of different kinds should not be grouped together into the same note.

Example

<notesStmt>
  <note>Historical commentary provided by Mark Cohen</note>
  <note>OCR scanning done at University of Toronto</note>
</notesStmt>

Content model

<content>
  <alternate minOccurs="1"
    maxOccurs="unbounded">
    <classRef key="model.noteLike"/>
    <elementRef key="relatedItem"/>
  </alternate>
</content>

Schema Declaration

element notesStmt { att.global.attributes, ( model.noteLike | relatedItem )+ }
<num> (number) contains a number, written in any form. 3.5.3. Numbers and Measures

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
( att.global.rendition (@rendition) ) ( att.global.linking ( @corresp, @next, @prev ) )
( att.global.analytic ( @ana ) ) ( att.global.facs ( @facs ) ) ( att.global.responsibility
( @cert, @resp ) ) ( att.global.source ( @source ) ) att.typed ( type, @subtype )

@type indicates the type of numeric value.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: cardinal absolute number, e.g. 21, 21.5
ordinal ordinal number, e.g. 21st
fraction fraction, e.g. one half or three-quarters
percentage a percentage

Note If a different typology is desired, other values can be used for this attribute.

@value supplies the value of the number in standard form.

Status Optional

Datatype teidata.numeric

Values a numeric value.

Note The standard form used is defined by the TEI datatype teidata.numeric.

May contain Empty element

Note A <pb> element should appear at the start of the page which it identifies. The

  global n attribute indicates the number or other value associated with this page.

  This will normally be the page number or signature printed on it, since the physical
sequence number is implicit in the presence of the <pb> element itself.

  The type attribute may be used to characterize the page break in any respect. The
more specialized attributes break, ed, or edRef should be preferred when the intent is
to indicate whether or not the page break is word-breaking, or to note the source
from which it derives.

Example Page numbers may vary in different editions of a text.

  <p> ... <pb n="145" ed="ed2"/></p>
  <!-- Page 145 in edition "ed2" starts here --> ... <pb n="283" ed="ed1"/></p>
  <!-- Page 283 in edition "ed1" starts here --> ... </p>

Example A page break may be associated with a facsimile image of the page it introduces
by means of the facsimile attribute

  <body>
  <pb n="1" facsimile="pagel.png"/>
  <!-- pagel.png contains an image of the page; the text it contains is encoded here -->
  </p>
  <!-- ... -->
  </body>
(punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark. [17.1.2. Below the Word Level 17.4.2.
Lightweight Linguistic Annotation]

<person> provides information about an identifiable individual, for example a participant in a language interaction, or a person referred to in a historical source.

13.3.2. The Person Element 15.2.2. The Participant Description

Module

Attributes

```xml
att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source)) att.editLike att.sortable (@sortKey)
```

@role specifies a primary role or classification for the person.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as artist, employer, author, relative, or servant, each of which should be associated with a definition. Such local definitions will typically be provided by a <valList> element in the project schema specification.

@sex specifies the sex of the person.

Status Optional

Datatype 1–∞ occurrences of teidata.sex separated by whitespace

Note Values for this attribute may be locally defined by a project, or may refer to an external standard, such as vCard’s sex property http://microformats.org/wiki/gender-formats (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 Representation of Human Sexes http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH’s Recommendations for Inclusive

@age specifies an age group for the person.

- **Status**: Optional
- **Datatype**: teidata.enumerated

**Note** Values for this attribute may be locally defined by a project, using arbitrary keywords such as infant, child, teen, adult, or senior, each of which should be associated with a definition. Such local definitions will typically be provided by a `<valList>` element in the project schema specification.

{
  att.global.attributes,
  att.written.attributes,
  ( (model.global | model.divTopPart)*, model.common, (model.global | model.common)*, (model.divBottomPart, model.global* )*)
}

Processing Model

<model behaviour="block"/>

<prefixDef> (prefix definition) defines a prefixing scheme used in teidata.pointer values, showing how abbreviated URIs using the scheme may be expanded into full URIs.

Module header
Attributes Attributes

att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.patternReplacement (@matchPattern, @replacementPattern)

@ident supplies a name which functions as the prefix for an abbreviated pointing scheme such as a private URI scheme. The prefix constitutes the text preceding the first colon.

Status Required

Datatype teidata.prefix

Note The value is limited to teidata.prefix so that it may be mapped directly to a URI prefix.

Contained by: listPrefixDef

May contain core: P linking: ab

Note The abbreviated pointer may be dereferenced to produce either an absolute or a relative URI reference. In the latter case it is combined with the value of xml:base in force at the place where the pointing attribute occurs to form an absolute URI in the usual manner as prescribed by XML Base.

Example
In the context of this project, private URIs with the prefix "ref" point to <gi>div</gi> elements in the project's global references.xml file.

**Content model**

```xml
<content>
  <classRef key="model.pLike" minOccurs="0" maxOccurs="unbounded"/>
</content>
```

**Schema Declaration**

```xml
element prefixDef
{
    att.global.attributes,
    att.patternReplacement.attributes,
    attribute ident { text },
    model.pLike*
}
```

**<profileDesc>** (text-profile description) provides a detailed description of non-bibliographic aspects of a text, specifically the languages and sublanguages used, the situation in which it was produced, the participants and their setting. [2.4. The Profile Description 2.1.1. The TEI Header and Its Components]

**Module header**

**Attributes**

`<publicationStmt>` (publication statement) groups information concerning the publication or distribution of an electronic or other text. [2.2.4. Publication, Distribution, Licensing, etc. 2.2. The File Description]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)  
( att.global.rendition (@rendition) ) ( att.global.linking ( @corresp, @next, @prev ) )  
( att.global.analytic (@ana) ) ( att.global.facs (@facs) ) ( att.global.responsibility  
( @cert, @resp ) ) ( att.global.source ( @source ) )

Contained by header: biblFull fileDesc

May contain core: address date p pubPlace publisher ref 

header: availability distributor idno

linking: ab

Note Where a publication statement contains several members of the `model.publicationStmtPart.agency` or `model.publicationStmtPart.detail` classes rather than one or more paragraphs or anonymous blocks, care should be taken to ensure that the repeated elements are presented in a meaningful order. It is a conformance requirement that elements supplying information about publication place, address, identifier, availability, and date be given following the name of the publisher, distributor, or authority concerned, and preferably in that order.

Example

```
<publisher>C. Muquardt </publisher>
<pubPlace>Bruxelles & Leipzig</pubPlace>
<date when="1846"/>
```

Example

```
<publisher>Chadwyck Healey</publisher>
<pubPlace>Cambridge</pubPlace>
<availability>
  <p>Available under licence only</p>
</availability>
```
Example

```
<publicationStmt>
  <publisher>Zea Books</publisher>
  <pubPlace>Lincoln, NE</pubPlace>
  <date>2017</date>
  <availability>
    <p>This is an open access work licensed under a Creative Commons Attribution 4.0 International license.</p>
  </availability>
  <ptr target="http://digitalcommons.unl.edu/zeabook/55"/>
</publicationStmt>
```

Content model

  <desc>Omit if located in teiHeader. </desc>
</model>
```

```xml
<q> (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

[3.3.3. Quotation]
```
Module core

Attributes

\begin{verbatim}
att.global ((@xml:id, @n, @xml:lang, @xml:base, @xml:space)
       (att.global.rendition (@rendition))
       (att.global.linking (@corresp, @next, @prev))
       (att.global.analytic (@ana))
       (att.global.facets (@facets))
       (att.cert. @resp))
       (att.global.source (@source))
       (att.ascribed.directed (@toWhom))
       (att.ascribed (@who))
\end{verbatim}

@type may be used to indicate whether the offset passage is spoken or thought, or to characterize it more finely.

Status  Optional

Datatype  teidata.enumerated

Suggested values include:

- **spoken**  representation of speech
- **thought**  representation of thought, e.g. internal monologue
- **written**  quotation from a written source
- **soCalled**  authorial distance
- **foreign**  linguistically distinct
- **distinct**  linguistically distinct
- **term**  technical term
- **emph**  rhetorically emphasized
- **mentioned**  referring to itself, not its normal referent

color data

Note May be used to indicate that a passage is distinguished from the surrounding text for reasons concerning which no claim is made. When used in this manner, \textless q \textgreater may be thought of as syntactic sugar for \textless hi \textgreater with a value of rend that indicates the use of such mechanisms as quotation marks.

Example

It is spelled \textless q \textgreater Tübingen\textless/q \textgreater — to enter the letter \textless q \textgreater u\textless/q \textgreater with an umlaut hold down the \textless q \textgreater option\textless/q \textgreater key and press \textless q \textgreater 0 0 f c \textless/q \textgreater

character data

Example If all that is desired is to call attention to the fact that the copy text has been regularized, `<reg>` may be used alone:

```xml
<q>Please <reg>knock</reg> if an <reg>answer</reg> is <reg>required</reg></q>
```

Example It is also possible to identify the individual responsible for the regularization, and, using the `<choice>` and `<orig>` elements, to provide both the original and regularized readings:

```xml
<q>Please <choice>
  <reg resp="#LB">knock</reg>
  <orig>cnk</orig>
</choice> if an <choice>
  <reg>answer</reg>
  <orig>nsr</orig>
</choice> is <choice>
  <reg>required</reg>
  <orig>reqd</orig>
</choice>
</q>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
element reg {
  att.global.attributes,
  att.editLike.attributes,
  att.typed.attributes,
  macro.paraContent}
```

Processing Model `<model behaviour="inline"/>`

```xml
<relatedItem>
  contains or references some other bibliographic item which is related to the present one in some specified manner, for example as a constituent or alternative version of it. [3.11.2.7. Related Items]
```

Module core

Attributes Attributes att.global (xml:id, @n, xml:lang, xml:base, xml:space) (att.global.rendition (@rendition)) (att.global.linking (corresp, @next, prev)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype)

@target points to the related bibliographic element by means of an absolute or relative URI reference

Status Optional

Datatype teidata.pointer
<relatedItem>

*Member of* model.biblPart

*Contained by*

core: bibl

*header:* notesStmt

*May contain*

core: bibl listBibl ref

*header:* biblFull

*Note* If the *target* attribute is used to reference the related bibliographic item, the element must be empty.

*Example*

```xml
<bibl xml:id="Shirley1953">
  <author>Shirley, James</author>
  <title type="main">The gentlemen of Venice</title>
  <pubPlace>New York</pubPlace>
  <publisher>Readex Microprint</publisher>
  <date>1953</date>
  <extent>1 microprint card, 23 x 15 cm.</extent>
  <relatedItem type="otherForm">
    <bibl>
      <author>Shirley, James</author>
      <title type="main">The gentlemen of Venice</title>
      <title type="sub">a tragi-comedie presented at the private house in Salisbury Court by Her Majesties servants</title>
      <pubPlace>London</pubPlace>
      <publisher>H. Moseley</publisher>
      <date>1655</date>
      <extent>78 p.</extent>
    </bibl>
  </relatedItem>
</bibl>
```

*Example*

```xml
<relatedItem type="otherForm"
  target="http://www.example.com/bibliography.xml#Shirley1655/>
```

*Schematron* <sch:report test="@target and count( child::* ) > 0">If the @target attribute on <sch:name/> is used, the relatedItem element must be empty</sch:report> <sch:assert test="@target or child::*">A relatedItem element should have either a 'target' attribute or a child element to indicate the related bibliographic item</sch:assert>

*Content model*

```xml
<content>
  <alternate minOccurs="0" maxOccurs="1">
    <classRef key="model.bibLike"/>
    <classRef key="model.ptrLike"/>
  </alternate>
</content>
```

*Schema Declaration*

```xml
element relatedItem
{
  att.global.attributes,
}
<rendition> supplies information about the rendition or appearance of one or more elements in the source text. [2.3.4. The Tagging Declaration]

<td></td>
</tr>
</tbody>
</table>

@scope where CSS is used, provides a way of defining pseudo-elements, that is, styling rules applicable to specific sub-portions of an element.

Status Optional

Datatype teidata.enumerated

Sample values include: first-line styling applies to the first line of the target element

first-letter styling applies to the first letter of the target element

before styling should be applied immediately before the content of the target element

after styling should be applied immediately after the content of the target element

@selector contains a selector or series of selectors specifying the elements to which the contained style description applies, expressed in the language specified in the scheme attribute.

Status Optional

Datatype teidata.text

Note Since the default value of the scheme attribute is assumed to be CSS, the default expectation for this attribute, in the absence of scheme, is that CSS selector syntax will be used.

While rendition is used to point from an element in the transcribed source to a <rendition> element in the header which describes how it appears, the selector attribute allows the encoder to point in the other direction: from a <rendition> in the header to a collection of elements which all share the same renditional features. In both cases, the intention is to record the appearance of the source text, not to prescribe any particular output rendering.

  (att.datable.w3c (@when, @notBefore, @notAfter, @from, @to))

Contained by
core: respStmt
May contain
Note The attribute ref, inherited from the class att.canonical may be used to indicate the kind of responsibility in a normalized form by referring directly to a standardized list of responsibility types, such as that maintained by a naming authority, for example the list maintained at http://www.loc.gov/marc/relators/relacode.html for bibliographic usage.

Example

```xml
<respStmt>
  <resp ref="http://id.loc.gov/vocabulary/relators/com.html">compiler</resp>
  <name>Edward Child</name>
</respStmt>
```

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq.limited"/>
</content>
```

Schema Declaration

```xml
element resp
{
  att.global.attributes,
  att.canonical.attributes,
  att.datable.attributes,
  macro.phraseSeq.limited
}
```

<respStmt> (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work. 3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.2. The Edition Statement 2.2.5. The Series Statement

Member of model.encodingDescPart

Contained by header: encodingDesc

May contain core: p

linking: ab

Note This element records all information about systematic inclusion or omission of portions of the text, whether a reflection of sampling procedures in the pure sense or of systematic omission of material deemed either too difficult to transcribe or not of sufficient interest.

Example

```
<samplingDecl>
  <p>Samples of up to 2000 words taken at random from the beginning, middle, or end of each text identified as relevant by respondents.</p>
</samplingDecl>
```

Content model

```
<content>
  <classRef key="model.pLike" minOccurs="1"
             maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```
element samplingDecl {att.global.attributes, model.pLike+}
```
<seg> (arbitrary segment) represents any segmentation of text below the chunk level.

Note The <seg> element may be used at the encoder’s discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a <ptr> or other similar element.

Example
<seriesStmt>

<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>

Example

<s>
<seg rend="caps" type="initial-cap">So father's only</seg> glory was the ballfield.
</s>

Example

<seg type="preamble">
<seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg>
<seg>Sinfiotli was the eldest of his sons ...</seg>
<seg>Borghild, Sigmund's wife, had a brother ...</seg>
</seg>

Content model

Example

for his nose was as sharp as a pen, and <sic>a Table</sic> of green fields.

Example If all that is desired is to call attention to the apparent problem in the copy text, <sic> may be used alone:

I don't know, Juan. It's so far in the past now – how <sic>we can</sic> prove or disprove anyone's theories?

Example It is also possible, using the <choice> and <corr> elements, to provide a corrected reading:

I don't know, Juan. It's so far in the past now – how <choice>
    <sic>we can</sic>
    <corr>can we</corr>
</choice> prove or disprove anyone's theories?

Example

for his nose was as sharp as a pen, and <choice>
    <sic>a Table</sic>
    <corr>a babblld</corr>
</choice> of green fields.

  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element speaker { att.global.attributes, macro.phraseSeq }
```

Processing Model

```xml
<model behaviour="block">
  <outputRendition> font-style:italic; </outputRendition>
</model>
```

```xml
<stage> (stage direction) contains any kind of stage direction within a dramatic text or fragment. [3.12.2. Core Tags for Drama 3.12. Passages of Verse or Drama 7.2.4. Stage Directions]
```

```
Attributes
  att.ascribed.directed (@toWhom) (att.ascribed (@who)) att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev)) (att.global.facs (@facs)) (att.global.analytic (@ana)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.placement (@place)
```

@type indicates the kind of stage direction.

```
Status
   Recommended
```

```
Datatype
   0–∞ occurrences of teidata.enumerated separated by whitespace
```

```
Suggested values include: setting describes a setting.

   entrance describes an entrance.

   exit describes an exit.

   business describes stage business.

   novelistic is a narrative, motivating stage direction.

   delivery describes how a character speaks.

   modifier gives some detail about a character.

   location describes a location.

   mixed more than one of the above
```

```
Note
   If the value mixed is used, it must be the only value. Multiple values may however be supplied if a single stage direction performs multiple functions, for example is both an entrance and a modifier.
```
Note The who attribute may be used to indicate more precisely the person or persons participating in the action described by the stage direction.

Example

```xml
<stage type="setting">A curtain being drawn.</stage>
<stage type="setting">Music</stage>
<stage type="entrance">Enter Husband as being thrown off his horse and falls.</stage>
<!-- Middleton: Yorkshire Tragedy -->
<stage type="exit">Exit pursued by a bear.</stage>
<stage type="business">He quickly takes the stone out.</stage>
<stage type="delivery">To Lussurioso.</stage>
<stage type="novelistic">Having had enough, and embarrassed for the family.</stage>
<!-- Lorraine Hansbury: a raisin in the sun -->
<stage type="modifier">Disguised as Ansaldo.</stage>
<stage type="entrance modifier">Enter Latrocinio disguised as an empiric</stage>
<!-- Middleton: The Widow -->
<stage type="location">At a window.</stage>
<stage rend="inline" type="delivery">Aside.</stage>
```

<supplied reason="illegible"
    source="#amanuensis_copy">very humble Servt</supplied>
Sydney Smith

Example

<supplied reason="omitted-in-original">Dedication</supplied> to the duke of Bejar
<surface> defines a written surface as a two-dimensional coordinate space, optionally grouping one or more graphic representations of that space, zones of interest within that space, and transcriptions of the writing within them. [11.1. Digital Facsimiles]

Module transcr

Attributes

att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
( att.global.rendition (@rendition)) ( att.global.linking (@corresp, @next, @prev))
( att.global.analytic (@ana)) ( att.global.facs (@facs)) ( att.global.responsibility (@cert, @resp)) ( att.global.source (@source)) att.coordinated (@start, @ulx, @uly, @trx, @try, @points) att.typed (@type, @subtype)

@attachment describes the method by which this surface is or was connected to the main surface

Status Optional

Datatype teidata.enumerated

Sample values include: glued glued in place

pinned pinned or stapled in place

sewn sewn in place
@flipping indicates whether the surface is attached and folded in such a way as to provide two writing surfaces

Status Optional

Datatype teidata.truthValue

Contained by facsimile surface zone

May contain core: cb desc gap graphic label lb milestone note pb

figures: figure formula

linking: anchor

transcr: fw surface zone

Note The <surface> element represents any two-dimensional space on some physical surface forming part of the source material, such as a piece of paper, a face of a monument, a billboard, a scroll, a leaf etc.

The coordinate space defined by this element may be thought of as a grid brx - ulx units wide and uly - lry units high.

The <surface> element may contain graphic representations or transcriptions of written zones, or both. The coordinate values used by every <zone> element contained by this element are to be understood with reference to the same grid.

Where it is useful or meaningful to do so, any grouping of multiple <surface> elements may be indicated using the <surfaceGrp> element.

Example

<facsimile>
  <surface ulx="0" uly="0" lrx="200" lry="300">
    <graphic url="Bovelles-49r.png"/>
  </surface>
</facsimile>

Content model

        ( model.global | model.labelLike | model.graphicLike )*,
        ( ( zone | line | path | surface | surfaceGrp ), model.global* )*
    }
}

<table> contains text displayed in tabular form, in rows and columns. [14.1.1. TEI
Tables]
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.responsibility
(@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype)
@rows indicates the number of rows in the table.
  Status Optional
  Datatype [teidata.count]
  Note If no number is supplied, an application must calculate the
  number of rows.
  Rows should be presented from top to bottom.
@cols (columns) indicates the number of columns in each row of the table.
  Status Optional
  Datatype [teidata.count]
  Note If no number is supplied, an application must calculate the
  number of columns.
  Within each row, columns should be presented left to right.

Character data

Example

```xml
<tagsDecl partial="true">
  <rendition xml:id="it" scheme="css" selector="foreign, hi"> font-style: italic; </rendition>
  <!-- ... -->
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="28" withId="2"> Used to mark English words italicized in the copy text. </tagUsage>
    <tagUsage gi="foreign"> Used to mark non-English words in the copy text. </tagUsage>
  </namespace>
</tagsDecl>
```

Content model

```xml
<content>
  <macroRef key="macro.limitedContent"/>
</content>
```

Schema Declaration

```xml
element tagUsage
{
  att.global.attributes,
  attribute gi { text },
  attribute occurs { text }?,
  attribute withId { text }?,
  macro.limitedContent}
```

<tagsDecl> (tagging declaration) provides detailed information about the tagging applied to a document. 2.3.4. The Tagging Declaration 2.3. The Encoding Description

Module header

Attributes

att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rendition)) (att.global.linking (@corresp, @next, @prev))
@partial indicates whether the element types listed exhaustively include all those found within <text>, or represent only a subset.

**Status** Recommended

**Datatype** teidata.truthValue

**Note** TEI recommended practice is to specify this attribute. When the <tagUsage> elements inside <tagsDecl> are used to list each of the element types in the associated <text>, the value should be given as false. When the <tagUsage> elements inside <tagsDecl> are used to provide usage information or default renditions for only a subset of the elements types within the associated <text>, the value should be true.

**Member of** model.encodingDescPart

**Contained by**
header: encodingDesc

**May contain**
header: namespace rendition

**Example**

```xml
<tagsDecl partial="true">
  <rendition xml:id="rend-it" scheme="css">
    selector="emph, hi, name, title">font-style: italic;</rendition>
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="467"/>
    <tagUsage gi="title" occurs="45"/>
  </namespace>
  <namespace name="http://docbook.org/ns/docbook">
    <tagUsage gi="para" occurs="10"/>
  </namespace>
</tagsDecl>
```

If the *partial* attribute were not specified here, the implication would be that the document in question contains only <hi>, <title>, and <para> elements.

**Content model**

```xml
<content>
  <sequence>
    <elementRef key="rendition" minOccurs="0" maxOccurs="unbounded"/>
    <elementRef key="namespace" minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
</content>
```

**Schema Declaration**

```xml
element tagsDecl
{
  att.global.attributes,
  attribute partial { text }?,
  ( rendition*, namespace* )
}
```
<taxonomy> defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy. [2.3.7. The Classification Declaration]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)

}
<teiCorpus>

contains the whole of a TEI encoded corpus, comprising a single corpus header and one or more <TEI> elements, each containing a single text header and a text. [4. Default Text Structure 15.1. Varieties of Composite Text]

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rendition)) (att.global/linking (@corresp, @next, @prev))
(att.global.analytic (@ana)) (att.global/facs (@facs)) (att.global/responsibility)
(@cert, @resp)) (att.global/source (@source)) att.typed (@type, @subtype)

@version specifies the version number of the TEI Guidelines against which this document is valid.
Status Optional
Datatype teidata.version

Note Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the source attribute on the associated <schemaSpec>.

Member of model.describedResource
Contained by core: teiCorpus
May contain core: teiCorpus
header: teiHeader
textstructure: TEI text
transcr: facsimile

Note Should contain one TEI header for the corpus, and a series of <TEI> elements, one for each text.

Example

```xml
<teiCorpus version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
  </teiHeader>
  <TEI>
    <teiHeader>

\textbf{Attributes} Attributes \textbf{att.global} (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
\textbf{att.global.rendition} (@rendition)
\textbf{att.global.linking} (@corresp, @next, @prev)
\textbf{att.global.analytic} (@ana)
\textbf{att.global.facs} (@facs)
\textbf{att.global.responsibility} (@cert, @resp)
\textbf{att.global.source} (@source)
\textbf{att.canonical} (@ref)
\textbf{att.databind} (@calendar, @period)
\textbf{att.databind.w3c} (@when, @notBefore, @notAfter, @from, @to)
\textbf{att.typed} (main, subordinate) @subtype

\textbf{@type} classifies the title according to some convenient typology.

\textit{Derived from} \textbf{att.typed}

\textbf{Status} Optional

\textbf{Datatype} teidata.enumerated

\textit{Sample values include:} main (main title)
\textbf{sub} (subordinate) subtitle, title of part
\textbf{alt} (alternate) alternate title, often in another language, by which the work is also known
\textbf{short} abbreviated form of title
\textbf{desc} (descriptive) descriptive paraphrase of the work functioning as a title

\textit{Note} This attribute is provided for convenience in analysing titles and processing them according to their type: where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single \texttt{<title>} element.

\textbf{@level} indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

\textbf{Status} Optional

\textbf{Datatype} teidata.enumerated

\textit{Legal values are:} a (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.
\textbf{m} (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works.
j (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper

s (series) the title applies to a series of otherwise distinct publications such as a collection

u (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)

Note The level of a title is sometimes implied by its context: for example, a title appearing directly within an <analytic> element is ipso facto of level a, and one appearing within a <series> element of level s. For this reason, the level attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.
identifier of a record in some external library system; the latter by pointing to an XML element somewhere containing the canonical form of the title.

Example

```xml
```

Example

```xml
<title>Hardy's Tess of the D'Urbervilles: a machine readable edition</title>
```

Example

```xml
<title type="full">Synthèse</title>
<title type="main">an international journal for epistemology, methodology and history of science</title>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
element title {
  att.global.attributes,
  att.typed.attribute.subtype,
  att.canonical.attributes,
  att.datable.attributes,
  attribute type { text }?,
  attribute level { "a" | "m" | "j" | "s" | "u" }?,
  macro.paraContent}
```

Processing Model

```xml
<modelSequence predicate="parent::titleStmt/parent::fileDesc">
  <model predicate="preceding-sibling::title" behaviour="text">
    <param name="content" value=" — "/>
  </model>
  <model behaviour="inline">
    <outputRendition>color: red; font-size: 2em;</outputRendition>
  </model>
</modelSequence>
<model predicate="not(@level) and parent::bibl" behaviour="inline"/>
<modelSequence predicate="@level='m' or not(@level)">
  <model behaviour="inline">
    <outputRendition>font-style: italic;</outputRendition>
  </model>
</modelSequence>
<model predicate="ancestor::biblFull" behaviour="text">
  <param name="content" value="", "/>
</model>
```

Example This example presumes that the prefix dc has been bound to the namespace http://purl.org/dc/elements/1.1/ and the prefix rdf is bound to the namespace http://www.w3.org/1999/02/22-rdf-syntax-ns#. Note: The about attribute on the <rdf:Description> in this example gives a URI indicating the resource to which the metadata contained therein refer. The <rdf:Description> in the second <xenoData> block has a blank about, meaning it is pointing at the current document, so the RDF is about the document within which it is contained, i.e. the TEI document containing the <xenoData> block. Similarly, any kind of relative URI may be used, including fragment identifiers (see SG-id). Do note, however, that if the contents of the <xenoData> block are to be extracted and used elsewhere, any relative URIs will have to be resolved accordingly.

<xenoData>
xmlns:dc="http://purl.org/dc/elements/1.1/">
xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"

<rdf:RDF>
<rdf:Description rdf:about="http://www.worldcat.org/oclc/606621663"/>
<dc:title>The description of a new world, called the blazing-world</dc:title>
<dc:creator>The Duchess of Newcastle</dc:creator>
<dc:date>1667</dc:date>
<dc:identifier>British Library, 8407.h.10</dc:identifier>
<dc:subject>utopian fiction</dc:subject>
</rdf:Description>
</rdf:RDF>
</xenoData>

<xenoData>
<rdf:RDF>
<rdf:Description rdf:about=""/>
<dc:title>The Description of a New World, Called the Blazing-World, 1668</dc:title>
<dc:creator>Cavendish, Margaret (Lucas), Duchess of Newcastle</dc:creator>
<dc:publisher>Women Writers Project</dc:publisher>
<dc:date>2002-02-12</dc:date>
<dc:subject>utopian fiction</dc:subject>
</rdf:Description>
</rdf:RDF>
</xenoData>
Example In this example, the prefix rdf is bound to the namespace http://www.w3.org/1999/02/22-rdf-syntax-ns#, the prefix dc is bound to the namespace http://purl.org/dc/elements/1.1/, and the prefix cc is bound to the namespace http://web.resource.org/cc/.

Example In this example, the prefix dc is again bound to the namespace http://www.openarchives.org/OAI/2.0/oai_dc/, and the prefix oai_dc is bound to the namespace http://www.openarchives.org/OAI/2.0/oai_dc/.
Example  In this example, the prefix `mods` is bound to the namespace

```xml
<xenoData>
  xmlns:mods="http://www.loc.gov/mods/v3">
  <mods:mods>
    <mods:titleInfo>
      <mods:title>Academic adaptation and cross-cultural learning experiences of Chinese students at American universities</mods:title>

```

Schema Declaration

```xml
element xenoData
{
  att.global.attributes,
  att.typed.attributes,
  ( text | anyElement-xenoData )
}
```

<zone> defines any two-dimensional area within a <surface> element. [11.1. Digital Facsimiles [11.2.2. Embedded Transcription]]

Module transcr

Attributes Attributes att.global ( @xml:id, @n, @xml:lang, @xml:base, @xml:space)
( att.global.rendition ( @rendition ) ) ( att.global.linking ( @corresp, @next, @prev ) )
( att.global.analytic ( @ana ) ) ( att.global.facs ( @facs ) ) ( att.global.responsibility
( @cert, @resp ) ) ( att.global.source ( @source ) ) att.coordinated ( @start, @ulx, @uly,
@lrx, @lry, @points ) att.typed ( @type, @subtype ) att.written ( @hand )
@rotate indicates the amount by which this zone has been rotated clockwise,
with respect to the normal orientation of the parent <surface> element as
implied by the dimensions given in the <msDesc> element or by the
coordinates of the <surface> itself. The orientation is expressed in arc
degrees.
Status Optional
Datatype teidata.count
Default 0
Member of model.linePart
Contained by transcr: surface zone
May contain analysis: c pc w
core: add ch choice del gap graphic hi lb milestone note pb unclear
figures: figure formula
Note The position of every zone for a given surface is always defined by reference to the
coordinate system defined for that surface.
A graphic element contained by a zone represents the whole of the zone.
A zone may be of any shape. The attribute points may be used to define a polygonal
zone, using the coordinate system defined by its parent surface.
A zone is always a closed polygon. Repeating the initial coordinate at the end of the
sequence is optional. To encode an unclosed path, use the <path> element.

Example

```
<surface ulx="14.54" uly="16.14" lrx="0" lry="0">
  <graphic url="stone.jpg"/>
  <zone points="4.6,6.3 5.25,5.85 6.2,6.6 8.19222,7.4125 9.89222,6.5875 10.9422,6.1375 11.4422,6.7125 8.21722,8.3125 6.2,7.65"/>
</surface>
```

This example defines a non-rectangular zone: see the illustration in section
PH-surfzone.

Example

```
<facsimile>
  <surface ulx="50" uly="20" lrx="400" lry="321">
    <zone ulx="0" uly="0" lrx="500" lry="321">
      <graphic url="graphic.png"/>
    </zone>
  </surface>
</facsimile>
```

This example defines a zone which has been defined as larger than its parent surface
in order to match the dimensions of the graphic it contains.

17.2 Model classes

**model.addrPart** groups elements such as names or postal codes which may appear as part of a postal address. [3.5.2. Addresses]

*Module* tei
*Used by* address
*Members* model.nameLike model.nameLike.agent name idno rs addrLine

**model.addressLike** groups elements used to represent a postal or email address. [1. The TEI Infrastructure]

*Module* tei
*Used by* model.pPart.data
*Members* address email

**model.attributable** groups elements that contain a word or phrase that can be attributed to a source. [3.3.3. Quotation 4.3.2. Floating Texts]

*Module* tei
*Used by* cit macro.phraseSeq model.inter sp
*Members* model.quoteLike cit quote floatingText

**model.availabilityPart** groups elements such as licences and paragraphs of text which may appear as part of an availability statement [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei
*Used by* availability
*Members* licence

**model.biblLike** groups elements containing a bibliographic description. [3.11. Bibliographic Citations and References]

*Module* tei
*Used by* cit listBibl model.inter model.personPart place relatedItem sourceDesc taxonomy
*Members* bibl biblFull listBibl

**model.biblPart** groups elements which represent components of a bibliographic description. [3.11. Bibliographic Citations and References]

*Module* tei
17  THE TEI SIMPLEPRINT SCHEMA

Used by bibl

Members model.imprintPart biblScope distributor pubPlace publisher model.respLike author editor respStmt availability bibl edition extent relatedItem

model.castItemPart groups component elements of an entry in a cast list, such as dramatic role or actor’s name.

Module tei

Used by castItem

Members actor role roleDesc

model.choicePart groups elements (other than <choice> itself) which can be used within a <choice> alternation. [3.4. Simple Editorial Changes]

Module tei

Used by choice

Members abbr corr expan orig reg seg sic supplied unclear

model.common groups common chunk- and inter-level elements. [1.3. The TEI Class System]

Module tei

Used by byline castItem closer date dateline docImprint head macro.paraContent macro.phraseSeq macro.specialPara opener time trailer
Members model.graphicLike formula graphic model.highlighted model.emphLike code foreign term title model.hiLike hi q model.lPart rhyme model.pPart.data model.addressLike address email model.dateLike date time model.measureLike measure num model.nameLike model.nameLike.agent name idno rs model.pPart.edit model.pPart.editorial abbr choice expan subst model.pPart.transcriptional add corr del orig reg sic supplied unclear model.phrase.xml model.ptrLike ref model_segLike c pc s seg w

Note This class of elements can occur within paragraphs, list items, lines of verse, etc.
**model.placeLike** groups elements used to provide information about places and their relationships.

*Module* tei

*Used by* listPlace, place, settingDesc

*Members* place

---

**model.profileDescPart** groups elements which may be used inside `<profileDesc>` and appear multiple times.

*Module* tei

*Used by* profileDesc

*Members* abstract, creation, langUsage, particDesc, settingDesc, textClass

---

**model.ptrLike** groups elements used for purposes of location and reference. [3.6. Simple Links and Cross-References]

*Module* tei

*Used by* bibl, cit, model.limitedPhrase, model.phrase, model.publicationStmtPart.detail, relatedItem

*Members* ref

---

**model.publicationStmtPart.agency** groups the child elements of a `<publicationStmt>` element of the TEI header that indicate an authorising agent. [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei

*Used by* publicationStmt

*Members* distributor, publisher

*Note* The agency child elements, while not required, are required if one of the detail child elements is to be used. It is not valid to have a detail child element without a preceding agency child element.

See also model.publicationStmtPart.detail.

---

**model.publicationStmtPart.detail** groups the agency-specific child elements of the `<publicationStmt>` element of the TEI header. [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei

*Used by* publicationStmt

*Members* model.ptrLike[ref], address, availability, date, idno, pubPlace

*Note* A detail child element may not occur unless an agency child element precedes it.

See also model.publicationStmtPart.agency.

---

**model.quoteLike** groups elements used to directly contain quotations.

*Module* tei
model.resource  groups separate elements which constitute the content of a digital resource, as opposed to its metadata. [1.3. The TEI Class System]
Module  tei
Used by  TEI teiCorpus
Members  facsimile text

model.respLike  groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.
Module  tei
Used by  editionStmt model.biblPart titleStmt
Members  author editor respStmt

model.segLike  groups elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 1.1. Linguistic Segment Categories]
Module  tei
Used by  bibl model.phrase
Members  c pc s seg w
Note  The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the <segmentation> element of the <encodingDesc> within the associated TEI header.

model.stageLike  groups elements containing stage directions or similar things defined by the module for performance texts. [7.3. Other Types of Performance Text]
Module  tei
Used by  lg model.inter sp
Members  stage
Note  Stage directions are members of class inter: that is, they can appear between or within component-level elements.

model.teiHeaderPart  groups high level elements which may appear more than once in a TEI header.
Module  tei
Used by  teiHeader
Members  encodingDesc profileDesc xenoData

model.titlepagePart  groups elements which can occur as direct constituents of a title page, such as <docTitle>, <docAuthor>, <docImprint>, or <epigraph>. [4.6. Title Pages]
17.3 Attribute classes

att.ascribed provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

Module tei
Members att.ascribed.directed q sp stage change
Attributes
 @who indicates the person, or group of people, to whom the element content is ascribed.
 Status Optional
 Datatype 1–∞ occurrences of teidata.pointer separated by whitespace
 In the following example from Hamlet, speeches (<sp>) in the body of the play are linked to <castItem> elements in the <castList> using the who attribute. <castItem type="role"> <role xml:id="Barnardo">Bernardo</role> </castItem> <castItem type="role"> <role xml:id="Francisco">Francisco</role> <roleDesc>a soldier</roleDesc> </castItem> <!-- ... --> <sp who="#Barnardo"> <speaker>Bernardo</speaker> <l n="1">Who's there?</l> </sp> <sp who="#Francisco"> <speaker>Francisco</speaker> <l n="2">Nay, answer me: stand, and unfold yourself.</l> </sp> Note For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified <person> element.

att.ascribed.directed provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

Module tei
Members q sp stage
Attributes
 @toWhom indicates the person, or group of people, to whom a speech act or action is directed.
 Status Optional
 Datatype 1–∞ occurrences of teidata.pointer separated by whitespace
 In the following example from Mary Pix’s The False Friend, speeches (<sp>) in the body of the play are linked to <castItem>
elements in the `<castList>` using the `toWhom` attribute, which is used to specify who the speech is directed to. Additionally, the `<stage>` includes `toWhom` to indicate the directionality of the action. `<castItem type="role">
  <role xml:id="emil">Emilius.</role>
</castItem>

<castItem type="role">
  <role xml:id="lov">Lovisa</role>
</castItem>

<castItem type="role">
  <role xml:id="serv">A servant</role>
</castItem>

<!-- ... -->

<sp who="#emil" toWhom="#lov">
  <speaker>Emil.</speaker>
  <l n="1">My love!</l>
</sp>

<sp who="#lov" toWhom="#emil">
  <speaker>Lov.</speaker>
  <l n="2">I have no Witness of my Noble Birth</l>
  <stage who="emil" toWhom="#serv">Pointing to her Woman.</stage>
  <l n="#">But that poor helpless wretch——</l>
</sp>

Note To indicate the recipient of written correspondence, use the elements used in section 2.4.6. Correspondence Description, rather than a `toWhom` attribute.

att.breaking provides an attribute to indicate whether or not the element concerned is considered to mark the end of an orthographic token in the same way as whitespace.

3.10.3. Milestone Elements

Module tei

Members cb lb milestone pb

Attributes Attributes

@break indicates whether or not the element bearing this attribute should be considered to mark the end of an orthographic token in the same way as whitespace.

Status Recommended

Datatype teidata.enumerated

Sample values include yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace

no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace

maybe the encoding does not take any position on this issue.

In the following lines from the ‘Dream of the Rood’, linebreaks occur in the middle of the words lāðost and reord-berendum. <ab>...
  eƿesa tome iu icƿæs ȝeƿorden ƿita heardoſt .
  leodum la<lb break="no"/> ðost ærþan ichim lifes
  peʒ rihnte ʒerymde reord be<lb break="no"/>
  rendum hþæt me þæþepeorðode puldres ealdor ofer...
</ab>
att.cReferencing provides an attribute which may be used to supply a canonical reference as a means of identifying the target of a pointer.

Module tei
Members ref term
Attributes Attributes
  @cRef (canonical reference) specifies the destination of the pointer by supplying a canonical reference expressed using the scheme defined in a <refsDecl> element in the TEI header
  Status Optional
  Datatype teidata.text

Note The value of cRef should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.

The <refsDecl> to use may be indicated with the decls attribute.

Currently these Guidelines only provide for a single canonical reference to be encoded on any given <ptr> element.

att.canonical provides attributes which can be used to associate a representation such as a name or title with canonical information about the object being named or referenced. [13.1.1. Linking Names and Their Referents]

Module tei
Members att.naming att.personal name author editor pubPlace rs actor catDesc date distributor docAuthor docTitle publisher resp respStmt term time title
Attributes Attributes
  @ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs.
  Status Optional
  Datatype 1–∞ occurrences of teidata.pointer separated by whitespace
  <name ref="http://viaf.org/viaf/109557338" type="person">Seamus Heaney</name>

Note The value must point directly to one or more XML elements or other resources by means of one or more URIs, separated by whitespace. If more than one is supplied the implication is that the name identifies several distinct entities.

att.citing provides attributes for specifying the specific part of a bibliographic item being cited. [1.3.1. Attribute Classes]

Module tei
Members biblScope
Attributes Attributes
  @unit identifies the unit of information conveyed by the element, e.g. columns, pages, volume, entry.
  Status Optional
  Datatype teidata.enumerated
Suggested values include: **volume** the element contains a volume number.

**issue** the element contains an issue number, or volume and issue numbers.

**page** the element contains a page number or page range.

**line** the element contains a line number or line range.

**chapter** the element contains a chapter indication (number and/or title)

**part** the element identifies a part of a book or collection.

**column** the element identifies a column.

**entry** the element identifies an entry number or label in a list of entries.

@from specifies the starting point of the range of units indicated by the **unit** attribute.

*Status Optional*

*Datatype teidata.word*

@to specifies the end-point of the range of units indicated by the **unit** attribute.

*Status Optional*

*Datatype teidata.word*

---

**att.coordinated** provides attributes which can be used to position their parent element within a two dimensional coordinate system.

**Module** transcr

**Members** surface, zone

**Attributes** Attributes

@start indicates the element within a transcription of the text containing at least the start of the writing represented by this zone or surface.

*Status Optional*

*Datatype teidata.pointer*

@ulx gives the x coordinate value for the upper left corner of a rectangular space.

*Status Optional*

*Datatype teidata.numeric*

@uly gives the y coordinate value for the upper left corner of a rectangular space.

*Status Optional*

*Datatype teidata.numeric*

@lrx gives the x coordinate value for the lower right corner of a rectangular space.

*Status Optional*

*Datatype teidata.numeric*

@lry gives the y coordinate value for the lower right corner of a rectangular space.

*Status Optional*

*Datatype teidata.numeric*

@points identifies a two dimensional area by means of a series of pairs of numbers, each of which gives the x,y coordinates of a point on a line enclosing the area.

*Status Optional*

*Datatype 3–∞ occurrences of teidata.point separated by whitespace*
**att.datable** provides attributes for normalization of elements that contain dates, times, or datable events. [3.5.4. Dates and Times 13.3.7. Dates and Times]

**Module** tei

**Members** change creation date idno licence name resp time title

**Attributes** Attributes

- **@calendar** indicates the system or calendar to which the date represented by the content of this element belongs.
  
  **Status** Optional
  **Datatype** teidata.pointer

  **Schematron** `<sch:rule context="tei:*[@calendar]">
  <sch:assert test="string-length(.) gt 0"> @calendar indicates the system or calendar to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert>
  </sch:rule>`

  **Note** Note that the calendar attribute (unlike datingMethod defined in att.datable.custom) defines the calendar system of the date in the original material defined by the parent element, not the calendar to which the date is normalized.

- **@period** supplies a pointer to some location defining a named period of time within which the datable item is understood to have occurred.
  
  **Status** Optional
  **Datatype** teidata.pointer

This superclass provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the **att.datable.w3c** class are provided. If the module for names & dates is loaded, this class also provides attributes from the **att.datable.iso** and **att.datable.custom** classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

**att.datable.w3c** provides attributes for normalization of elements that contain datable events conforming to the W3C XML Schema Part 2: Datatypes Second Edition. [3.5.4. Dates and Times 13.3.7. Dates and Times]

**Module** tei

**Members** change creation date idno licence name resp time title

**Attributes** Attributes

- **@when** supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.
  
  **Status** Optional
  **Datatype** teidata.temporal.w3c

  Examples of W3C date, time, and date & time formats. `<p>`
  `<date when="1945-10-24">24 Oct 45</date>`
  `<date when="1996-09-24T07:25:00Z">September 24th, 1996 at`
This list begins in
the year 1632, more precisely on Trinity Sunday, i.e. the
Sunday after
Pentecost, in that year the
<date calendar="#julian"
when="1632-06-06">27th of May (old style)</date>.

<opener>

<dateline>
<placeName>Dorchester, Village</placeName>,
<date when="1828-03-02">March 2d. 1828.</date>
</dateline>

<salute>To
Mrs. Cornell</salute>,
<time when="12:00:00">noon</time>

</opener>

@notBefore specifies the earliest possible date for the event in standard form, e.g.

yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

@notAfter specifies the latest possible date for the event in standard form, e.g.

yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

@from indicates the starting point of the period in standard form, e.g.

yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

@to indicates the ending point of the period in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

Schematron <sch:rule context="tei:*[@when]">
  <sch:report test="@notBefore|@notAfter|@from|@to" role="nonfatal">The @when attribute cannot be used with any other att.dateable.w3c attributes.</sch:report> </sch:rule>

Schematron <sch:rule context="tei:*[@from]"> <sch:report test="@notBefore" role="nonfatal">The @from and @notBefore attributes cannot be used together.</sch:report> </sch:rule>

Schematron <sch:rule context="tei:*[@to]"> <sch:report test="@notAfter" role="nonfatal">The @to and @notAfter attributes cannot be used together.</sch:report> </sch:rule>

Example
Note The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar.

The most commonly-encountered format for the date portion of a temporal attribute is `yyyy-mm-dd`, but `yyyy`, `--mm`, `---dd`, `yyyy-mm`, or `--mm-dd` may also be used. For the time part, the form `hh:mm:ss` is used.

Note that this format does not currently permit use of the value `0000` to represent the year 1 BCE; instead the value `-0001` should be used.

**att.dimensions** provides attributes for describing the size of physical objects.

<tr>
<td>Attributes</td>
<td><code>@unit</code>, <code>@quantity</code>, <code>@extent</code>, <code>@scope</code></td>
</tr>
</tbody>
</table>

- **@unit** names the unit used for the measurement
  - Status: Optional
  - Datatype: `teidata.enumerated`
  - Legal values are: `chars` characters, `lines` lines, `pages` pages, `words` words, `cm` centimetres, `mm` millimetres, `in` inches

- **@quantity** specifies the length in the units specified
  - Status: Optional
  - Datatype: `teidata.numeric`

- **@extent** indicates the size of the object concerned using a project-specific vocabulary combining quantity and units in a single string of words.
  - Status: Optional
  - Datatype: `teidata.text`

  `<gap extent="5 words"/>`
  `<height extent="half the page"/>`

- **@scope** where the measurement summarizes more than one observation, specifies the applicability of this measurement.
  - Status: Optional
  - Datatype: `teidata.enumerated`

  Sample values include: `all` measurement applies to all instances, `most` measurement applies to most of the instances inspected, `range` measurement applies to only the specified range of instances.

**att.divLike** provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]
**att.docStatus** provides attributes for use on metadata elements describing the status of a document.

**Module** tei

**Members** div lg

**Attributes**

- **att.metrical** (@rhyme)
- **att.fragmentable** (@part)

**@org** (organization) specifies how the content of the division is organized.

- **Status** Optional
- **Datatype** teidata.enumerated

Legal values are: composite no claim is made about the sequence in which the immediate contents of this division are to be processed, or their inter-relationships.

uniform the immediate contents of this element are regarded as forming a logical unit, to be processed in sequence.[Default]

**@sample** indicates whether this division is a sample of the original source and if so, from which part.

- **Status** Optional
- **Datatype** teidata.enumerated

Legal values are: initial division lacks material present at end in source.

- medial division lacks material at start and end.
- final division lacks material at start.
- unknown position of sampled material within original unknown.
- complete division is not a sample.[Default]
**Example**

```xml
<revisionDesc status="published">
  <change when="2010-10-21" status="published"/>
  <change when="2010-10-02" status="cleared"/>
  <change when="2010-08-02" status="embargoed" who="#MSM"/>
  <change when="2010-05-01" status="frozen" who="#LB"/>
  <change when="2010-03-01" status="draft" who="#LB"/>
</revisionDesc>
```

**att.editLike** provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [3.4. Simple Editorial Changes][10.3.1. Origination][13.3.2. The Person Element][11.3.1. Core Elements for Transcriptional Work]

*Module* tei

*Members* att.transcriptional\[add del subst corr date expan gap name person place reg supplied time unclear\]

*Attributes* Attributes

*Note* The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.

Each pointer on the *source* (if present) corresponding to a witness or witness group should reference a bibliographic citation such as a `<witness>`, `<msDesc>`, or `<bibl>` element, or another external bibliographic citation, documenting the source concerned.

**att.edition** provides attributes identifying the source edition from which some encoded feature derives.

*Module* tei

*Members* cb lb milestone pb

*Attributes* Attributes

- **@ed** (edition) supplies a sigil or other arbitrary identifier for the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.
  - *Status* Optional
  - *Datatype* 1–∞ occurrences of teidata.word separated by whitespace

- **@edRef** (edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.
  - *Status* Optional
  - *Datatype* 1–∞ occurrences of teidata.pointer separated by whitespace

*Example*

```xml
<l>Of Mans First Disobedience, <lb ed="1674"/> and <lb ed="1667"/> the Fruit</l>
```
Of that Forbidden Tree, whose mortal tast Brought Death into the World, and all our woe.

Example

```xml
<listBibl>
  <bibl xml:id="stapledon1937">
    <author>Olaf Stapledon</author>,
    <title>Starmaker</title>, <publisher>Methuen</publisher>,
    <date>1937</date>
  </bibl>
  <bibl xml:id="stapledon1968">
    <author>Olaf Stapledon</author>,
    <title>Starmaker</title>, <publisher>Dover</publisher>, <date>1968</date>
  </bibl>
</listBibl>
```

Looking into the future aeons from the supreme moment of the cosmos, I saw the populations still with all their strength maintaining the essentials of their ancient culture, still living their personal lives in zest and endless novelty of action, ... I saw myself still preserving, though with increasing difficulty, my lucid consciousness;

att.fragmentable provides an attribute for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

Module tei

Members

| att.divLike | div | att.segLike | pc | seg | w | ab | p |

Attributes

@part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.

Status Optional

Datatype teidata.enumerated

Legal values are: Y (yes) the element is fragmented in some (unspecified) respect

N (no) the element is not fragmented, or no claim is made as to its completeness[Default]

I (initial) this is the initial part of a fragmented element

M (medial) this is a medial part of a fragmented element

F (final) this is the final part of a fragmented element

Note The values I, M, or F should be used only where it is clear how the element may be reconstituted.

att.global provides attributes common to all elements in the TEI encoding scheme.

[1.3.1.1. Global Attributes]
Module tei

Members TEI ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline castGroup castItem castList catDesc catRef category cb cell change char charDecl charName choice cit classCode classDecl closer code corr creation date dateline del docAuthor docDate docEdition docImprint docTitle editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText foreign formula front fw g gap glyph glyphName graphic group head hi idno imprimatur item keywords l label langUsage language lb lg licence list listBibl listChange listPerson listPlace listPrefixDef mapping measure milestone name namespace note notesStmt num opener orig p particDesc pb pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs s salute samplingDecl seg seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear w xenoData zone

Attributes Attributes att.global.rendition (@rendition) att.global.linking (@corresp, @next, @prev) att.global.analytic (@ana) att.global.facs (@facs) att.global.responsibility (@cert, @resp) att.global.source (@source)

@xml:id (identifier) provides a unique identifier for the element bearing the attribute.
Status Optional
Datatype ID

Note The xml:id attribute may be used to specify a canonical reference for an element; see section 3.10. Reference Systems.

@n (number) gives a number (or other label) for an element, which is not necessarily unique within the document.
Status Optional
Datatype teidata.text

Note The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

@xml:lang (language) indicates the language of the element content using a tag generated according to BCP 47.
Status Optional
Datatype teidata.language

<p>... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">ariki</foreign> or chief (Routledge 1920:205,210) and their connections to ancestral territorial organization.</p>

Note The xml:lang value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify xml:lang at the highest appropriate level, noticing that a different default may be needed for the <teiHeader> from that needed for the associated resource element or elements,
and that a single TEI document may contain texts in many languages.

The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry. For a good general overview of the construction of language tags, see http://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php.

The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <language> element with a matching value for its ident attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@xml:base provides a base URI reference with which applications can resolve relative URI references into absolute URI references.

Status Optional

Datatype teidata.pointer

<div type="bibl">
  <head>Bibliography</head>
  <listBibl xml:base="http://www.lib.ucdavis.edu/BWRP/Works/">
    <bibl>
      <author>
        <name>Landon, Letitia Elizabeth</name>
      </author>
      <ref target="LandLVowOf.sgm">
        <title>The Vow of the Peacock</title>
      </ref>
    </bibl>
    <bibl>
      <author>
        <name>Compton, Margaret Clephane</name>
      </author>
      <ref target="NortMIrene.sgm">
        <title>Irene, a Poem in Six Cantos</title>
      </ref>
    </bibl>
    <bibl>
      <author>
        <name>Taylor, Jane</name>
      </author>
      <ref target="TaylJEssay.sgm">
        <title>Essays in Rhyme on Morals and Manners</title>
      </ref>
    </bibl>
  </listBibl>
</div>

@xml:space signals an intention about how white space should be managed by applications.

Status Optional

Datatype teidata.enumerated

Legal values are: default signals that the application’s default white-space processing modes are acceptable
preserve indicates the intent that applications preserve all white space
Note: The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle xml:space correctly.

\textbf{att.global.analytic} provides additional global attributes for associating specific analyses or interpretations with appropriate portions of a text. [17.2. Global Attributes for Simple Analyses 17.3. Spans and Interpretations]

\textit{Module analysis}

\textit{Members} \textbf{att.global.TEI ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl charName choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText foreign formula front fw g gap glyph glyphName graphic group head hi idno imprimatur item keywords label langUsage language lb lg licence listBibl listChange listPerson listPlace listPrefixDef mapping measure milestone name namespace note notesStmt num opener orig p particDesc ph pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs salute samplingDecl seg seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy telCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear w xenoData zone

\textit{Attributes}

\textbf{@ana} (analysis) indicates one or more elements containing interpretations of the element on which the \textit{ana} attribute appears.

\textit{Status} Optional

\textit{Datatype} 1–∞ occurrences of \textit{teidata.pointer} separated by whitespace

\textbf{Note}: When multiple values are given, they may reflect either multiple divergent interpretations of an ambiguous text, or multiple mutually consistent interpretations of the same passage in different contexts.

\textbf{att.global.facs} provides an attribute used to express correspondence between an element containing transcribed text and all or part of an image representing that text. [11.1. Digital Facsimiles]

\textit{Module transcr}

\textit{Members} \textbf{att.global.TEI ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl charName choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText foreign formula front fw g gap glyph glyphName graphic group head hi idno imprimatur item keywords label langUsage language lb lg licence listBibl listChange listPerson listPlace listPrefixDef mapping measure milestone name namespace note notesStmt num opener orig p particDesc ph pc person place
att.global.linking provides a set of attributes for hypertextual linking. [16. Linking, Segmentation, and Alignment]

Module linking

Members att.global.TEl ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl charName choice cit classCode classDecl closer code creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expan extent facsimile figDesc figure head hi idno imprimatur item keywords lb label langUsage list listBibl listChange listPerson listPlace listPrefixDef mapping measure milestone name namespace note notesStmt num opener orig p particDesc pb pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs rs salute samplingDecl seg seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear w xenoData zone

Attributes Attributes

@facs (facsimile) points to all or part of an image which corresponds with the content of the element.
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

<group>
  <text xml:id="t1-gl-t1" xml:lang="mi">
  </text>
  <text xml:id="t1-gl-t2" xml:lang="en">
  </text>
</group>
<head>An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.</head>

<p>…</p>
</div>
</body>
</text>
</group>

In this example a <group> contains two <text> s, each containing the same document in a different language. The correspondence is indicated using corresp. The language is indicated using xml:lang, whose value is inherited; both the tag with the corresp and the tag pointed to by the corresp inherit the value from their immediate parent.

<!-- In a placeography called "places.xml" -->
<place xml:id="LOND1"
corresp="people.xml#LOND2 people.xml#GENI1">
  <placeName>London</placeName>
  <desc>The city of London...</desc>
</place>

<!-- In a literary personography called "people.xml" -->
<person xml:id="LOND2"
corresp="places.xml#LOND1 #GENI1">
  <persName type="lit">London</persName>
  <note>
    <p>Allegorical character representing the city of London</p>
  </note>
</person>

<person xml:id="GENI1"
corresp="places.xml#LOND1 #LOND2">
  <persName type="lit">London’s Genius</persName>
  <note>
    <p>Personification of London’s genius. Appears as an allegorical character in mayoral shows.</p>
  </note>
</person>

In this example, a <place> element containing information about the city of London is linked with two <person> elements in a literary personography. This correspondence represents a slightly looser relationship than the one in the preceding example; there is no sense in which an allegorical character could be substituted for the physical city, or vice versa, but there is obviously a correspondence between them.

@next points to the next element of a virtual aggregate of which the current element is part.

Status Optional
Datatype teidata.pointer
Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

@prev (previous) points to the previous element of a virtual aggregate of which the current element is part.

Status Optional
Datatype teidata.pointer
Note It is recommended that the element indicated be of the same type as the element bearing this attribute.
att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.3. Rendition Indicators]

Module tei

Members: att.global TEI ab abbr abstract actor add addrLine address anchor argument author availability back bib bibFull bibScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl charName choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expan extent facsimile figDesc figure fileDesc floatingText foreign formula front fw g glyph glyphName graphic group head hi id idno imprimatur item keywords label langUsage language lb lg licence list listBibl listChange listPerson listPlace listPrefixDef mapping measure milestone name namespace note notesStmt num opener orig p particDesc ph pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs salute samplingDecl seg seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear w xenoData zone

Attributes

@rendition points to a description of the rendering or presentation used for this element in the source text.

Status Optional

Datatype: 1–∞ occurrences of teidata.pointer separated by whitespace

Suggested values include: simple:allcaps all capitals

- simple:blackletter black letter or gothic typeface
- simple:bold bold typeface
- simple:bottombraced marked with a brace under the bottom of the text
- simple:boxed border around the text
- simple:centre centred
- simple:cursive cursive typeface
- simple:display block display
- simple:doublestrikethrough strikethrough with double line
- simple:doubleunderline underlined with double line
- simple:dropcap initial letter larger or decorated
- simple:float floated out of main flow
- simple:hyphen with a hyphen here (eg in line break)
- simple:inline inline rendering
- simple:justify justified text
- simple:italic italic typeface
- simple:larger larger type
- simple:left aligned to the left or left-justified
- simple:leftbraced marked with a brace on the left side of the text
- simple:letterspace larger-than-normal spacing between letters, usually for emphasis
- simple:literal fixed-width typeface, spacing preserved
simple:normalstyle upright shape and default weight of typeface
simple:normalweight normal typeface weight
simple:right aligned to the right or right-justified
simple:rightbraced marked with a brace to the right of the text
simple:rotateleft rotated to the left
simple:rotateright rotated to the right
simple:smallcaps small caps
simple:smaller smaller type
simple:strikethrough strike through
simple:subscript subscript
simple:superscript superscript
simple:topbraced marked with a brace above the text
simple:typewriter fixed-width typeface, like typewriter
simple:underline underlined with single line
simple:wavyunderline underlined with wavy line

<head rendition="#ac #sc">
  <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On Her <lb/>
  <hi rendition="#normal">New Blazing-World</hi>.
</head>

<!-- elsewhere... -->

<rendition xml:id="sc" scheme="css">font-variant: small-caps</rendition>
<rendition xml:id="normal" scheme="css">font-variant: normal</rendition>
<rendition xml:id="ac" scheme="css">text-align: center</rendition>

Note: The rendition attribute is used in a very similar way to the class attribute defined for XHTML but with the important distinction that its function is to describe the appearance of the source text, not necessarily to determine how that text should be presented on screen or paper.

If rendition is used to refer to a style definition in a formal language like CSS, it is recommended that it not be used in conjunction with rend. Where both rendition and rend are supplied, the latter is understood to override or complement the former.

Each URI provided should indicate a <rendition> element defining the intended rendition in terms of some appropriate style language, as indicated by the scheme attribute.

Schematron: <s:rule context="tei::*[@rendition]"> <s:let name="results" value="for $val in tokenize(normalize-space(@rendition),\"s\\'+\") return starts-with($val,'simple:') or (starts-with($val,'#') and //tei:rendition[@xml:id=substring($val,2)])"/>
  <s:assert test="every $x in $results satisfies $x"> Error: Each of the rendition values in "<s:value-of select="@rendition"/>" must point to a local ID or to a token in the Simple scheme (<s:value-of select="$results"/>).</s:assert> </s:rule>

Schematron: <s:rule context="tei::*[@corresp]"> <s:let name="results" value="for $t in tokenize(normalize-space(@corresp),\"s\\'+\") return starts-with($t,'#') and not(id(substring($t,2)))"/>
  <s:report test="some $x in $results satisfies $x"> Error: Every local pointer in "<s:value-of select="@corresp"/>" must point to an ID in this document (<s:value-of select="$results"/>).</s:report> </s:rule>
att.global.responsibility provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the degree of certainty associated with it. [1.3.1.1.4. Sources, certainty, and responsibility 3.4. Simple Editorial Changes 11.3.2.2. Hand, Responsibility, and Certainty Attributes 17.3. Spans and Interpretations 13.1.1. Linking Names and Their Referents]

Module tei

Members att.global[TEI] ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl charName choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText formula front fw g gap glyph glyphName graphic group head hi idno imprimatur item keywords l label langUsage language lb lg licence list biblListChange listPerson listPlace listPrefixDef mapping measure milestone name namespace note notesStmt num opener orig part particDesc pb pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs salute samplingDecl seg seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear w xenoData zone

Attributes Attributes

@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.
Status Optional
Datatype teidata.probCert

@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note To reduce the ambiguity of a resp pointing directly to a person or organization, we recommend that resp be used to point not to an agent (<person>) or <org>) but to a <respStmt>, <author>, <editor> or similar element which clarifies the exact role played by the agent. Pointing to multiple <respStmt>s allows the encoder to specify clearly each of the roles played in part of a TEI file (creating, transcribing, encoding, editing, proofing etc.).

Example

Blessed are the
<choice>
  <sic>cheesemakers</sic>
  <corr resp="#editor" cert="high">peacemakers</corr>
</choice>: for they shall be called the children of God.

Example
att.global.source provides an attribute used by elements to point to an external source.  

Module: tei  

Members: att.global, TEI, abbr, abbr, abstract, actor, add, addrLine, address, anchor, argument, author, availability, back, bibl, biblFull, biblScope, body, byline, c, castGroup, castItem, castList, catDesc, catRef, category, cb, cell, change, char, charDecl, charName, choice, cit, classCode, classDecl, closer, code, corr, creation, date, dateline, del, desc, distributor, div, docAuthor, docDate, docEdition, docImprint, docTitle, edition, editionStmt, editor, editorialDecl, email, encodingDesc, epigraph, epigraph, expand, extent, facsimile, figDesc, figure, fileDesc, floatingText, foreign, formula, front, fw, g, gap, glyph, glyphName, graphic, group, head, hi, idno, imprimatur, item, keywords, l, label, langUsage, language, lb, lg, licence, list, listBibl, listChange, listPerson, listPlace, listPrefixDef, mapping, measure, milestone, name, namespace, note, notesStmt, num, opener, orig, p, particDesc, pb, pc, person, place, postscript, prefixDef, profileDesc, projectDesc, pubPlace, publicationStmt, publisher, q, quote, ref, refsDecl, reg, relatedItem, rendition, resp, respStmt, revisionDesc, rhyme, role, roleDesc, row, s, salute, samplingDecl, seg, seriesStmt, set, settingDesc, sic, signed, sourceDesc, sp, speaker, stage, subst, supplied, surface, table, tagUsage, tagsDecl, taxonomy, teiCorpus, teiHeader, term, text, textClass, time, title, titlePage, titlePart, titleStmt, trailer, unclear, w, xenoData, zone  

Attributes:  

@source specifies the source from which some aspect of this element is drawn.  

Status: Optional  

Datatype: 1–∞ occurrences of teidata pointer separated by whitespace  

Note: The source attribute points to an external source. When used on elements describing schema components such as <schemaSpec> or <moduleRef>, it identifies the source from which declarations for the components of the object being defined may be obtained. On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.

In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, or private scheme URI that is expanded to an absolute URI as documented in a <prefixDef>.  

334
If more than one location is specified, the default assumption is that the required source should be obtained by combining the resources indicated.

Example

```xml
<p>
<!-- ... --> As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quote source="#mcc_2012">'Collaboration' is a problematic and should be a contested term.</quote>
<!-- ... -->
</p>
```

Example

```xml
<p>
<!-- ... -->
<quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote>
<!-- ... -->
</p>
```

Example

```xml
<bibl xml:id="chicago_15_ed">
</bibl>
```

Example

```xml
<elementRef key="p" source="tei:2.0.1"/>
```

Include in the schema an element named `p` available from the TEI P5 2.0.1 release.

Example

```xml
<schemaSpec ident="myODD" source="mycompiledODD.xml">
<!-- further declarations specifying the components required -->
</schemaSpec>
```

Create a schema using components taken from the file mycompiledODD.xml.

**att.internetMedia** provides attributes for specifying the type of a computer resource using a standard taxonomy.

**Module** tei

**Members** `att.media[graphic] ref`

**Attributes** Attributes

- **@mimeType** (MIME media type) specifies the applicable multimedia internet mail extension (MIME) media type
  
  **Status** Optional

  **Datatype** 1–∞ occurrences of `teidata.word` separated by whitespace
Example In this example *mimeType* is used to indicate that the URL points to a TEI XML file encoded in UTF-8.

```xml
<ref mimeType="application/tei+xml; charset=UTF-8" target="http://sourceforge.net/p/tei/code/HEAD/tree/trunk/P5/Source/guidelines-en.xml"/>
```

Note This attribute class provides an attribute for describing a computer resource, typically available over the internet, using a value taken from a standard taxonomy. At present only a single taxonomy is supported, the Multipurpose Internet Mail Extensions (MIME) Media Type system. This typology of media types is defined by the Internet Engineering Task Force in RFC 2046. The list of types is maintained by the Internet Assigned Numbers Authority (IANA). The *mimeType* attribute must have a value taken from this list.

**att.linguistic** provides a set of attributes concerning linguistic features of tokens, for usage within token-level elements, specifically `<w>` and `<pc>` in the analysis module. [17.4.2. Lightweight Linguistic Annotation]

Module analysis

Members `pc` `w`

Attributes

- **@lemma** provides a lemma (base form) for the word, typically uninflected and serving both as an identifier (e.g. in dictionary contexts, as a headword), and as a basis for potential inflections.
  Status Optional
  Datatype `teidata.text`
  ```xml
  <w lemma="wife">wives</w>
  <w lemma="Arznei">Artzeneyen</w>
  ```
- **@lemmaRef** provides a pointer to a definition of the lemma for the word, for example in an online lexicon.
  Status Optional
  Datatype `teidata.pointer`
  ```xml
  <w type="verb" lemma="hit" lemmaRef="http://www.example.com/lexicon/hitvb.xml">hitt</w><m type="suffix">ing</m>
  ```

These attributes make it possible to encode simple language corpora and to add a layer of linguistic information to any tokenized resource. See section 17.4.2. Lightweight Linguistic Annotation for discussion.

**att.measurement** provides attributes to represent a regularized or normalized measurement.

Module tei

Members `measure`

Attributes

- **@unit** indicates the units used for the measurement, usually using the standard symbol for the desired units.
  Status Optional
Datatype [teidata.enumerated]

Suggested values include: m (metre) SI base unit of length
- kg (kilogram) SI base unit of mass
- s (second) SI base unit of time
- Hz (hertz) SI unit of frequency
- Pa (pascal) SI unit of pressure or stress
- Ω (ohm) SI unit of electric resistance
- L (litre) 1 dm³
- t (tonne) 10³ kg
- ha (hectare) 1 hm²
- Å (ångström) 10⁻¹⁰ m
- mL (millilitre)
- cm (centimetre)
- dB (decibel) see remarks, below
- kbit (kilobit) 10³ or 1000 bits
- Kibit (kibibit) 2¹⁰ or 1024 bits
- kB (kilobyte) 10³ or 1000 bytes
- KiB (kibibyte) 2¹⁰ or 1024 bytes
- MB (megabyte) 10⁶ or 1 000 000 bytes
- MiB (mebibyte) 2²⁰ or 1 048 576 bytes

Note If the measurement being represented is not expressed in a particular unit, but rather is a number of discrete items, the unit count should be used, or the unit attribute may be left unspecified. Wherever appropriate, a recognized SI unit name should be used (see further http://www.bipm.org/en/publications/si-brochure/: http://physics.nist.gov/cuu/Units/). The list above is indicative rather than exhaustive.

@unitRef points to a unique identifier stored in the xml:id of a <unitDef> element that defines a unit of measure.

Status Optional

Datatype [teidata.pointer]

@quantity specifies the number of the specified units that comprise the measurement

Status Optional

Datatype [teidata.numeric]

@commodity indicates the substance that is being measured

Status Optional

Datatype 1–∞ occurrences of [teidata.word] separated by whitespace

Note In general, when the commodity is made of discrete entities, the plural form should be used, even when the measurement is of only one of them.

Schematron <sch:rule context="tei:*[@unitRef]">

<sch:report test="@unit" role="info">The @unit attribute may be unnecessary when @unitRef is present.</sch:report>

</sch:rule>

Note This attribute class provides a triplet of attributes that may be used either to
regularize the values of the measurement being encoded, or to normalize them with respect to a standard measurement system.

```xml
<l>So weren't you gonna buy <measure quantity="0.5" unit="gal"
commodity="ice cream">half a gallon</measure>, baby</l>
<l>So won't you go and buy <measure quantity="1.893" unit="L"
commodity="ice cream">half a gallon</measure>, baby?</l>
```

The unit should normally be named using the standard symbol for an SI unit (see further \url{http://www.bipm.org/en/publications/si-brochure/}; \url{http://physics.nist.gov/cuu/Units/}). However, encoders may also specify measurements using informally defined units such as lines or characters.

**att.media** provides attributes for specifying display and related properties of external media.

*Module* tei

*Members* graphic

*Attributes*

- **att.internetMedia**
  - `@mimeType`
  - Status: Optional

- **@width** Where the media are displayed, indicates the display width
  - Status: Optional
  - Datatype: `teidata.outputMeasurement`

- **@height** Where the media are displayed, indicates the display height
  - Status: Optional
  - Datatype: `teidata.outputMeasurement`

- **@scale** Where the media are displayed, indicates a scale factor to be applied when generating the desired display size
  - Status: Optional
  - Datatype: `teidata.numeric`

**att.metrical** defines a set of attributes which certain elements may use to represent metrical information. [6.4. Rhyme and Metrical Analysis]

*Module* verse

*Members* `att.divLike [div lg] att.segLike [c pc s seg w]`

*Attributes*

- **@rhyme** (rhyme scheme) specifies the rhyme scheme applicable to a group of verse lines.
  - Status: Recommended
  - Datatype: `token`

*Note* By default, the rhyme scheme is expressed as a string of alphabetic characters each corresponding with a rhyming line. Any non-rhyming lines should be represented by a hyphen or an X. Alternative notations may be defined as for *met* by use of the `<metDecl>` element in the TEI header.

When the default notation is used, it does not make sense to specify this attribute on any unit smaller than a line. Nor does the default notation provide any way to record internal rhyme, or to specify
non-conventional rhyming practice. These extensions would require user-defined alternative notations.

**att.milestoneUnit** provides an attribute to indicate the type of section which is changing at a specific milestone. [3.10.3. Milestone Elements] [2.3.6.3. Milestone Method] [2.3.6. The Reference System Declaration]

**Module** core

**Members** milestone

**Attributes** Attributes

@unit provides a conventional name for the kind of section changing at this milestone.

**Status** Required

**Datatype** teidata.enumerated

*Suggested values include:* page physical page breaks (synonymous with the `<pb>` element).

- column column breaks.
- line line breaks (synonymous with the `<lb>` element).
- book any units termed book, liber, etc.
- poem individual poems in a collection.
- canto cantos or other major sections of a poem.
- speaker changes of speaker or narrator.
- stanza stanzas within a poem, book, or canto.
- act acts within a play.
- scene scenes within a play or act.
- section sections of any kind.
- absent passages not present in the reference edition.

**unnumbered** passages present in the text, but not to be included as part of the reference.

```xml
<milestone n="23"
ed="La"
unit="Dreissiger"/>
... <milestone n="24"
ed="AV"
unit="verse"/> ...
```

**Note** If the milestone marks the beginning of a piece of text not present in the reference edition, the special value absent may be used as the value of unit. The normal interpretation is that the reference edition does not contain the text which follows, until the next `<milestone>` tag for the edition in question is encountered.

In addition to the values suggested, other terms may be appropriate (e.g. *Stephanus* for the Stephanus numbers in Plato).

The type attribute may be used to characterize the unit boundary in any respect other than simply identifying the type of unit, for example as word-breaking or not.

**att.naming** provides attributes common to elements which refer to named persons, places, organizations etc. [3.5.1. Referring Strings] [3.3.6. Names and Nyms]
att.notated provides an attribute to indicate any specialised notation used for element content.

Module tei
Members c formula quote s seg w
Attributes Attributes
   @notation names the notation used for the content of the element.
   Status Optional
   Datatype teidata.enumerated

att.patternReplacement provides attributes for regular-expression matching and replacement. [16.2.3. Using Abbreviated Pointers 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration 2.3.6.2. Search-and-Replace Method]

Module header
Members prefixDef
Attributes Attributes
   @matchPattern specifies a regular expression against which the values of other attributes can be matched.
   Status Required
   Datatype teidata.pattern
   Note The syntax used should follow that defined by W3C XPath syntax. Note that parenthesized groups are used not only for establishing order of precedence and atoms for quantification, but also for creating subpatterns to be referenced by the replacementPattern attribute.
   @replacementPattern specifies a replacement pattern, that is, the skeleton of a relative or absolute URI containing references to groups in the matchPattern which, once subpattern substitution has been performed, complete the URI.
**att.personal** (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names]

**Module** tei

**Members** name

**Attributes** Attributes att.naming (@role, @nymRef) (att.canonical (@ref))

@full indicates whether the name component is given in full, as an abbreviation or simply as an initial.

**Status** Optional

**Datatype** teidata.enumerated

**Legal values are:** yes the name component is spelled out in full.[Default]

abb (abbreviated) the name component is given in an abbreviated form.

init (initial letter) the name component is indicated only by one initial.

@sort specifies the sort order of the name component in relation to others within the name.

**Status** Optional

**Datatype** teidata.count

---

**att.placement** provides attributes for describing where on the source page or object a textual element appears. [3.4.3. Additions, Deletions, and Omissions] [11.3.1.4. Additions and Deletions]

**Module** tei

**Members** add figure fw head label note stage trailer

**Attributes** Attributes

@place specifies where this item is placed.

**Status** Recommended

**Datatype** 1–∞ occurrences of teidata.enumerated separated by whitespace

**Legal values are:** above above the line

below below the line
top at the top of the page
top-right at the top right of the page  
top-left at the top left of the page  
top-centre at the top center of the page  
bottom-right at the bottom right of the page  
bottom-left at the bottom left of the page  
bottom-centre at the bottom centre of the page  
bottom at the foot of the page  
tablebottom underneath a table  
margin-right in the right-hand margin  
margin in the outer margin  
margin-inner in the inner margin  
margin-left in the left-hand margin  
opposite on the opposite, i.e. facing, page.  
overleaf on the other side of the leaf.  
overstrike superimposed on top of the current context  
end at the end of the volume.  
divend at the end the current division.  
parend at the end the current paragraph.  
inline within the body of the text.  
inspace in a predefined space, for example left by an earlier scribe.  
block formatted as an indented paragraph  

<add place="margin">[An addition written in the margin]</add>  
<add place="bottom opposite">[An addition written at the foot of the current page and also on the facing page]</add>  
<note place="bottom">Ibid, p.7</note>

**att.pointing** provides a set of attributes used by all elements which point to other elements by means of one or more URI references.  

<table>

<tr>
<td>Attributes</td>
<td><strong>Attributes</strong></td>
</tr>
</tbody>
</table>
| @targetLang | specifies the language of the content to be found at the destination referenced by target, using a language tag generated according to BCP 47.  
| Status | Optional |
| Datatype | teidata.language |
| Schematron | <sch:rule context="tei:*[not(self::tei:schemaSpec)][@targetLang]">  
| | <sch:assert test="@target">@targetLang should only be used on @target if @target is specified.</sch:assert> </sch:rule>  
| | <linkGrp xml:id="pol-swh_aln_2.1-linkGrp">  
| | <ptr xml:id="pol-swh_aln_2.1.1-ptr"  
| | target="pol/UDHR/text.xml#pol_txt_1-head"  
| | type="tuv"  
| | targetLang="pl"/>  
| | <ptr xml:id="pol-swh_aln_2.1.2-ptr"  
| | target="swh/UDHR/text.xml#swh_txt_1-head"|
In the example above, the <linkGrp> combines pointers at parallel fragments of the *Universal Declaration of Human Rights*: one of them is in Polish, the other in Swahili.

*Note* The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <language> element with a matching value for its *ident* attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

[@target](#) specifies the destination of the reference by supplying one or more URI references.

*Status* Optional

*Schematron* `<s:rule context="tei: *[@target]"> <s:let name="results" value="for $t in tokenize(normalize-space(@target),'\s+') return starts-with($t,'#') and not(id(substring($t,2)))"/> <s:report test="some $x in $results satisfies $x"> Error: Every local pointer in "<s:value-of select="@target"/>" must point to an ID in this document (<s:value-of select="$results"/>)/</s:report> </s:rule>`

*Datatype* 1–∞ occurrences of `teidata.pointer` separated by whitespace

*Note* One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. [TEI%20Consortium](#).

[@evaluate](#) specifies the intended meaning when the target of a pointer is itself a pointer.

*Status* Optional

*Datatype* `teidata.enumerated`

*Legal values are:* **all** if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.

**one** if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.

**none** no further evaluation of targets is carried out beyond that needed to find the element specified in the pointer’s target.

*Note* If no value is given, the application program is responsible for deciding (possibly on the basis of user input) how far to trace a chain of pointers.

**att.resourced** provides attributes by which a resource (such as an externally held media file) may be located.

*Module* `tei`

*Members* `graphic`

*Attributes* `Attributes`
@url (uniform resource locator) specifies the URL from which the media concerned may be obtained.

**Status** Required

**Datatype** teidata.pointer

---

**att.segLike** provides attributes for elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors | 17.1. Linguistic Segment Categories]

**Module** tei

**Members** c pc s seg w

**Attributes**

- @function characterizes the function of the segment.

  **Status** Optional

  **Datatype** teidata.enumerated

  **Note** Attribute values will often vary depending on the type of element to which they are attached. For example, a `<cl>`, may take values such as coordinate, subject, adverbial etc. For a `<phr>`, such values as subject, predicate etc. may be more appropriate. Such constraints will typically be implemented by a project-defined customization.

---

**att.sortable** provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [9.1. Dictionary Body and Overall Structure]

**Module** tei

**Members** bibl biblFull idno item list listBibl listChange listPerson listPlace person place term

**Attributes**

- @sortKey supplies the sort key for this element in an index, list or group which contains it.

  **Status** Optional

  **Datatype** teidata.word

  **Note** The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produced the desired order; specifics of sort key construction are application-dependent.

  Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under fourth, and McCoy may be alphabetized under maccoy, while A1, A4, and A5 may all appear in numeric order alphabetized between a- and AA. The sort key is
required if the orthography of the dictionary entry does not suffice to determine its location.

**att.spanning** provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [11.3.1.4. Additions and Deletions](#)

**Attribute Classes**

Module tei

Members cb lb milestone pb

Attributes Attributes

@spanTo indicates the end of a span initiated by the element bearing this attribute.

Status Optional

Datatype teidata.pointer

Schematron The @spanTo attribute must point to an element following the current element `<sch:rule context="tei:*[@spanTo]">` `<sch:assert test="id(substring(@spanTo,2)) and following::*[@xml:id=substring(current()/@spanTo,2)]">The element indicated by @spanTo (`<sch:value-of select="@spanTo"/>`) must follow the current element `<sch:name/>` <;/sch:assert> <;/sch:rule>

The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the spanTo attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.

**att.styleDef** provides attributes to specify the name of a formal definition language used to provide formatting or rendition information.

Module tei

Members rendition

Attributes Attributes

@scheme identifies the language used to describe the rendition.

Status Optional

Datatype teidata.enumerated

Legal values are: css Cascading Stylesheet Language xslfo Extensible Stylesheet Language Formatting Objects free Informal free text description other A user-defined rendition description language

*Note* If no value for the @scheme attribute is provided, then the default assumption should be that CSS is in use.

@schemeVersion supplies a version number for the style language provided in scheme.

Status Optional

Datatype teidata.versionNumber
Schematron <sch:rule context="tei:*[@schemeVersion]">
  <sch:assert test="@scheme and not(@scheme = 'free')">
    @schemeVersion can only be used if @scheme is specified.
  </sch:assert>
</sch:rule>

Note If schemeVersion is used, then scheme should also appear, with a value other than free.

---

**att.timed** provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [§ 3.5. Temporal Information]

**Module** tei  
**Members** gap  
**Attributes** Attributes

@start indicates the location within a temporal alignment at which this element begins.  
**Status** Optional  
**Datatype** teidata.pointer  
**Note** If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.

@end indicates the location within a temporal alignment at which this element ends.  
**Status** Optional  
**Datatype** teidata.pointer  
**Note** If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.

---

**att.transcriptional** provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [11.3.1.4. Additions and Deletions]

**Module** tei  
**Members** add del subst  
**Attributes** Attributes att.editLike att.written (@hand)

@status indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.  
**Status** Optional  
**Datatype** teidata.enumerated  

*Sample values include:* **duplicate** all of the text indicated as an addition duplicates some text that is in the original, whether the duplication is word-for-word or less exact.  
**duplicate-partial** part of the text indicated as an addition duplicates some text that is in the original  
**excessStart** some text at the beginning of the deletion is marked as deleted even though it clearly should not be deleted.
excessEnd  some text at the end of the deletion is marked as deleted even though it clearly should not be deleted.
shortStart  some text at the beginning of the deletion is not marked as deleted even though it clearly should be.
shortEnd  some text at the end of the deletion is not marked as deleted even though it clearly should be.
partial  some text in the deletion is not marked as deleted even though it clearly should be.
unremarkable  the deletion is not faulty. [Default]

Note  Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common.
Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.

@cause  documents the presumed cause for the intervention.

Status  Optional
Datatype  teidata.enumerated

@seq  (sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.

Status  Optional
Datatype  teidata.count

att.translatable  provides attributes used to indicate the status of a translatable portion of an ODD document.

Module  tei
Members  desc
Attributes  Attributes

@versionDate  specifies the date on which the source text was extracted and sent to the translator

Status  Optional
Datatype  teidata.temporal.w3c

Note  The versionDate attribute can be used to determine whether a translation might need to be revisited, by comparing the modification date on the containing file with the versionDate value on the translation. If the file has changed, changelogs can be checked to see whether the source text has been modified since the translation was made.

att.typed  provides attributes which can be used to classify or subclassify elements in any way.
Module tei

Members TEI ab abbr add anchor bibl cb castItem cit corr date del desc div figure floatingText fw g head idno label lb lg list listBibl listChange listPerson listPlace mapping measure milestone name note num ph pc place quote ref reg relatedItem rhyme rs rs seg surface table teiCorpus term text time title titlePage titlePart trailer w xenoData zone

Attributes

@type characterizes the element in some sense, using any convenient classification scheme or typology.
Status Optional
Datatype teidata.enumerated

Note The type attribute is present on a number of elements, not all of which are members of att.typed, usually because these elements restrict the possible values for the attribute in a specific way.

@subtype provides a sub-categorization of the element, if needed
Status Optional
Datatype teidata.enumerated

Note The subtype attribute may be used to provide any sub-classification for the element additional to that provided by its type attribute.

Schematron

<sch:rule context="tei:*[@subtype]"> <sch:assert test="@type">The <sch:name/> element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert> </sch:rule>

Note When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <valList> element in the project-specific schema description, as described in 23.3.1.3. Modification of Attribute and Attribute Value Lists.

att.written provides an attribute to indicate the hand in which the content of an element was written in the source being transcribed. 1.3.1. Attribute Classes

Module tei

Members att.transcriptional add del subst ab closer div figure fw head hi label note opener p postscript salute seg signed text trailer zone

Attributes Attributes
@hand points to a `<handNote>` element describing the hand considered responsible for the content of the element concerned.

*Status Optional*

*Datatype* `teidata.pointer`

### 17.4 Macros

#### macro.limitedContent

(paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]

*Module* `tei`

*Used by* `desc`, `figDesc`, `rendition`, `tagUsage`

*Content model*

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.limitedPhrase"/>
    <classRef key="model.inter"/>
  </alternate>
</content>
```

*Declaration*

```xml
macro.limitedContent = ( text | model.limitedPhrase | model.inter )*```

#### macro.paraContent

(paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]

*Module* `tei`

*Used by* `ab`, `add`, `corr`, `docEdition`, `hi`, `imprimatur`, `orig`, `p`, `ref`, `reg`, `rhyme`, `salute`, `seg`, `sic`, `signed`, `supplied`, `title`, `titlePart`, `unclear`

*Content model*

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>
    <classRef key="model.global"/>
    <elementRef key="lg"/>
    <classRef key="model.lLike"/>
  </alternate>
</content>
```

*Declaration*

```xml
macro.paraContent =
  ( text | model.gLike | model.phrase | model.inter | model.global | lg | model.lLike )*```
macro.phraseSeq (phrase sequence) defines a sequence of character data and phrase-level elements. [1.4.1. Standard Content Models]

Module: tei
Used by: abbr, actor, addrLine, author, biblScope, distributor, docAuthor, docDate, edition, editor, email, expan, extent, foreign, fw, label, measure, name, num, pubPlace, publisher, role, roleDesc, rs, speaker, term

Content model

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.attributable"/>
    <classRef key="model.phrase"/>
    <classRef key="model.global"/>
  </alternate>
</content>
```

Declaration

`macro.phraseSeq = ( text | model.gLike | model.attributable | model.phrase | model.global )*`

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]

Module: tei
Used by: classCode, language, resp

Content model

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.limitedPhrase"/>
    <classRef key="model.global"/>
  </alternate>
</content>
```

Declaration

`macro.phraseSeq.limited = ( text | model.limitedPhrase | model.global )*`

cmacro.specialPara (‘special’ paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]
**Module** tei
**Used by** cell | change | item | licence | note | q | quote | stage

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>
    <classRef key="model.divPart"/>
    <classRef key="model.global"/>
  </alternate>
</content>
```

**Declaration**

```java
macro.specialPara =
  ( text | model.gLike | model.phrase | model.inter | model.divPart | model.global )*
```

**macro.xtext** (extended text) defines a sequence of character data and gaiji elements.

**Module** tei
**Used by** mapping

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
  </alternate>
</content>
```

**Declaration**

```java
macro.xtext = ( text | model.gLike )*
```

### 17.5 Datatypes

**teidata.certainty** defines the range of attribute values expressing a degree of certainty.

**Module** tei
**Used by** teidata.probCert

**Content model**

```xml
<valList type="closed">
  <valItem ident="high"/>
  <valItem ident="medium"/>
  <valItem ident="low"/>
  <valItem ident="unknown"/>
</valList>
```
Declaration

\texttt{teidata.certainty = "high" | "medium" | "low" | "unknown"}

Note  Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

\texttt{teidata.count} defines the range of attribute values used for a non-negative integer value used as a count.

\textbf{Module} tei

\textbf{Used by} Element:

- \texttt{table/@rows}
- \texttt{table/@cols}
- \texttt{tagUsage/@occurs}
- \texttt{tagUsage/@withId}
- \texttt{zone/@rotate}

\textbf{Content model}

\begin{verbatim}
<content>
 <dataRef name="nonNegativeInteger"/>
</content>
\end{verbatim}

\textbf{Declaration} \texttt{teidata.count = xsd:nonNegativeInteger}

\textbf{Note} Any positive integer value or zero is permitted

\texttt{teidata.duration.iso} defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats

\textbf{Module} tei

\textbf{Used by} Content model

\begin{verbatim}
<content>
 <dataRef name="token"
  restriction="[0-9.,DHMPRSTWYZ/:\-]+"/>
</content>
\end{verbatim}

\textbf{Declaration}

\texttt{teidata.duration.iso = token \{ pattern = "[0-9.,DHMPRSTWYZ/:\-]+" \}}

\textbf{Example}

\begin{verbatim}
<time dur-iso="PT0.75H">three-quarters of an hour</time>
\end{verbatim}
Example

```xml
<date dur-iso="P1,5D">a day and a half</date>
```

Example

```xml
<date dur-iso="P14D">a fortnight</date>
```

Example

```xml
<time dur-iso="PT0.02S">20 ms</time>
```

Note

A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see ISO 8601 *Data elements and interchange formats — Information interchange — Representation of dates and times.*

**teidata.duration.w3c** defines the range of attribute values available for representation of a duration in time using W3C datatypes.

**Module** tei

**Used by**

**Content model**

```xml
<content> <dataRef name="duration"/></content>
```

**Declaration**

```xml
teidata.duration.w3c = xsd:duration
```

Example

```xml
<time dur="PT45M">forty-five minutes</time>
```

Example

```xml
<date dur="P1DT12H">a day and a half</date>
```

Example

```xml
<date dur="P7D">a week</date>
```

Example

```xml
<time dur="PT0.02S">20 ms</time>
```

Note

A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see the [W3C specification](https://www.w3.org/TR/2013/REC-xslt-20130108/).

353
teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

**Module** tei

**Used by** Element:

- abbr/@type
- availability/@status
- castItem/@type
- cell/@role
- desc/@type
- formula/@notation
- fwr/@type
- gap/@reason
- gap/@agent
- idno/@type
- list/@type
- measure/@type
- name/@type
- num/@type
- pc/@force
- pc/@unit
- person/@role
- person/@age
- q/@type
- rendition/@scope
- row/@role
- stage/@type
- surface/@attachment
- title/@type
- title/@level
- titlePage/@type
- titlePart/@type
- unclear/@reason
- unclear/@agent

**Content model** `<content> <dataRef key="teidata.word"/></content>`

**Declaration** `teidata.enumerated = teidata.word`

**Note** Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace. Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a `<valList>` element.
teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. [6.1. Language Identification]

Module tei

Used by Element: 

- `language/@ident`

Content model

```
<content>
  <alternate>
    <dataRef name="language"/>
    <valList>
      <valItem ident=""/>
    </valList>
  </alternate>
</content>
```

Declaration `teidata.language = xsd:language | ( "" )`

Note The values for this attribute are language tags as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.

A language tag, per BCP 47, is assembled from a sequence of components or subtags separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

- **language** The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at [http://www.iana.org/assignments/language-subtag-registry](http://www.iana.org/assignments/language-subtag-registry). It is recommended that this code be written in lower case.

- **script** The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at [http://unicode.org/iso15924/iso15924-codes.html](http://unicode.org/iso15924/iso15924-codes.html). The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

- **region** Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at [https://www.iso.org/obp/ui/#search/code/](https://www.iso.org/obp/ui/#search/code/). The latter consist of 3 digits; the list of codes can be found at [http://unstats.un.org/unsd/methods/m49/m49.htm](http://unstats.un.org/unsd/methods/m49/m49.htm).

- **variant** An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.
extension An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

private use An extension that uses the initial subtag of the single letter x (i.e., starts with x-) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding \texttt{<language>} element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been grandfathered from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with x-, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding \texttt{<language>} element in the TEI header.

Examples include

- \texttt{sn} Shona
- \texttt{zh-TW} Taiwanese
- \texttt{zh-Hant-HK} Chinese written in traditional script as used in Hong Kong
- \texttt{en-SL} English as spoken in Sierra Leone
- \texttt{pl} Polish
- \texttt{es-MX} Spanish as spoken in Mexico
- \texttt{es-419} Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.

---

teidata.name defines the range of attribute values expressed as an XML Name.

\begin{itemize}
  \item Module tei
  \item Used by Element:
    \begin{itemize}
      \item \texttt{tagUsage/@gi}
    \end{itemize}
  \end{itemize}

\begin{itemize}
  \item Content model \texttt{<content> <dataRef name=\"Name\"/></content>}
  \item Declaration \texttt{teidata.name = xsd:Name}
  \item Note Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see \url{http://www.w3.org/TR/REC-xml/#dt-name}): for example they cannot include whitespace or begin with digits.
\end{itemize}

---

teidata.namespace defines the range of attribute values used to indicate XML namespaces as defined by the W3C Namespaces in XML Technical Recommendation.

\begin{itemize}
  \item Module tei
  \item Used by Element:
    \begin{itemize}
      \item \texttt{namespace/@name}
    \end{itemize}
\end{itemize}
teidata.numeric defines the range of attribute values used for numeric values.

Module tei

Used by Element:

- `num/@value`

Content model

```xml
<content>
  <alternate>
    <dataRef name="double"/>
    <dataRef name="token"
      restriction="(\-?\[d]+/\-?\[d]+)"/>
    <dataRef name="decimal"/>
  </alternate>
</content>
```

Declaration

```
teidata.numeric =
  xsd:double | token { pattern = "(\-?\[d]+/\-?\[d]+)" } | xsd:decimal
```

Note Any numeric value, represented as a decimal number, in floating point format, or as a ratio.

To represent a floating point number, expressed in scientific notation, E notation, a variant of exponential notation, may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.

A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.

Module tei

Used by

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[\-+]?d+(\.d+)?(\%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"/>
</content>
```
Declaration

teidata.outputMeasurement =
token
{
    pattern = "[\-+]?\d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"
}

Example

<figure>
<head>The TEI Logo</head>
<figDesc>Stylized yellow angle brackets with the letters <mentioned>TEI</mentioned> in between and <mentioned>text encoding initiative</mentioned> underneath, all on a white background.</figDesc>
<graphic height="600px" width="600px"
    url="http://www.tei-c.org/logos/TEI-600.jpg"/>
</figure>

Note These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

teidata.pattern defines attribute values which are expressed as a regular expression.

Module tei

Used by

Content model

<content> <dataRef name="token"/></content>

Declaration

```
teidata.pattern = token
```

Note A regular expression, often called a pattern, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings Handel, Händel, and Haendel can be described by the pattern H(ä|ae?)ndel (or alternatively, it is said that the pattern H(ä|ae?)ndel matches each of the three strings) Wikipedia

This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.

teidata.point defines the data type used to express a point in cartesian space.

Module tei

Used by

Content model

```
<content>
    <dataRef name="token"
</content>
```

Declaration

Example

```xml
<facsimile>
  <surface ulx="0" uly="0" lrx="400" lry="280">
    <zone points="220,100 300,210 170,250 123,234">
      <graphic url="handwriting.png "/>
    </zone>
  </surface>
</facsimile>
```

Note A point is defined by two numeric values, which should be expressed as decimal numbers. Neither number can end in a decimal point. E.g., both 0.0,84.2 and 0.84 are allowed, but 0.,84. is not.

**teidata.pointer** defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei

*Used by Element:*

- `catRef/@scheme`
- `change/@target`
- `classCode/@scheme`
- `g/@ref`
- `keywords/@scheme`
- `note/@targetEnd`
- `relatedItem/@target`

*Content model*

```xml
<content> <dataRef name="anyURI"/></content>
```

*Declaration*  

```xml
teidata.pointer = xsd:anyURI
```

**teidata.prefix** defines a range of values that may function as a URI scheme name.

Module tei

*Used by Element:*

- `prefixDef/@ident`

*Content model*

```xml
<content>
  <dataRef name="token"
```
teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

Module tei
Used by teidata.probCert
Content model
```
<content>
  <alternate>
    <dataRef key="teidata.probability"/>
    <dataRef key="teidata.certainty"/>
  </alternate>
</content>
```

Declaration
```
teidata.probCert = teidata.probability | teidata.certainty
```

Note  Probability is expressed as a real number between 0 and 1; 0 representing certainly false and 1 representing certainly true.

teidata.probability defines the range of attribute values expressing a probability.

Module tei
Used by teidata.probCert
Content model
```
<content> <dataRef name="double"/></content>
```

Declaration
```
teidata.probability = xsd:double
```

Note  Probability is expressed as a real number between 0 and 1; 0 representing certainly false and 1 representing certainly true.

teidata.replacement defines attribute values which contain a replacement template.

Module tei
Used by
Content model
```
<content> <textNode/></content>
```

Declaration
```
teidata.replacement = text
```

Note  Probability is expressed as a real number between 0 and 1; 0 representing certainly false and 1 representing certainly true.

teidata.sex defines the range of attribute values used to identify human or animal sex.
Module tei
Used by Element:

- `person/@sex`

Content model:

```xml
<content> <dataRef key="teidata.word"/></content>
```

Declaration: `teidata.sex = teidata.word`

Note: Values for attributes using this datatype may be locally defined by a project, or may refer to an external standard, such as vCard’s sex property [http://microformats.org/wiki/gender-formats](http://microformats.org/wiki/gender-formats) (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 Representation of Human Sexes [http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip](http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip) (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH’s Recommendations for Inclusive Data Collection of Trans People [http://transhealth.ucsf.edu/trans?page=lib-data-collection].

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

Module tei
Used by Element:

- `docDate/@when`

Content model:

```xml
<content>
  <alternate>
    <dataRef name="date"/>
    <dataRef name="gYear"/>
    <dataRef name="gMonth"/>
    <dataRef name="gDay"/>
    <dataRef name="gYearMonth"/>
    <dataRef name="gMonthDay"/>
    <dataRef name="time"/>
    <dataRef name="dateTime"/>
  </alternate>
</content>
```

Declaration:

```python
teidata.temporal.w3c =
  xsd:date
  | xsd:gYear
  | xsd:gMonth
  | xsd:gDay
  | xsd:gYearMonth
  | xsd:gMonthDay
  | xsd:time
  | xsd:dateTime
```
Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of Unicode characters possibly including whitespace.

Module tei
Used by Element:
  • rendition/@selector

Content model <content> <dataRef name="string"/></content>

Declaration teidata.text = string

Note Attributes using this datatype must contain a single token in which whitespace and other punctuation characters are permitted.

teidata.truthValue defines the range of attribute values used to express a truth value.

Module tei
Used by Element:
  • listChange/@ordered
  • note/@anchored
  • pc/@pre
  • surface/@flipping
  • tagsDecl/@partial

Content model <content> <dataRef name="boolean"/></content>

Declaration teidata.truthValue = xsd:boolean

Note The possible values of this datatype are 1 or true, or 0 or false.

This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: teidata.xTruthValue.

teidata.version defines the range of attribute values which may be used to specify a TEI or Unicode version number.

Module tei
Used by Element:
  • teiCorpus/@version

Content model

<content>
<dataRef name="token"
  restriction="[\d]+(\.\d+){0,2}"
</content>
teidata.versionNumber defines the range of attribute values used for version numbers.

Module tei

Used by

tedata.enumerated
tedata.sexElement:

- code/@lang
- rhyme/@label
- supplied/@reason

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[^\p{C}\p{Z}]+"/>
</content>
```

Declaration

```python
teidata.versionNumber = token { pattern = "[^\p{C}\p{Z}]+" }
```

Note Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

tedata.xmlName defines attribute values which contain an XML name.

Module tei

Used by
Content model:

```
<content> <dataRef name="NCName"/></content>
```

Declaration:

```
tedata.xmlName = xsd:NCName
```

Note: The rules defining an XML name form a part of the XML Specification.

--

teidata.xpath defines attribute values which contain an XPath expression.

Module: tei

Used by:

Content model:

```
<content> <textNode/></content>
```

Declaration:

```
tedata.xpath = text
```

Note: Any XPath expression using the syntax defined in XSLT2.

When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.

17.6 Summary of changes

The TEI simplePrint schema uses the TEI infrastructure and gaiji modules unchanged.

Module tei

Module gaiji

A subset of 45 elements is selected from the TEI header module. In addition, elements `<particDesc>` and `<settingDesc>` are provided from the corpus module. The class membership of `<particDesc>` is changed to ensure that it can only appear inside `<profileDesc>`. Secondly, a Schematron rule is added to the `<text>` element to ensure that elements `<term>` and `<biblFull>` can appear only in the header element, even though the schema permits them additionally in text.

Module header

Module corpus

Some attributes and attribute classes are removed. The range of values available for several attributes is constrained.

Class `att.datcat` delete
Class `att.declarable` delete
Class `att.declarable` delete
Class `att.ranging` delete
Class `att.global.linking` change
Class `att.canonical` change
Class `att.editLike` change
Class `att.pointing` change
Class `att.global.rendition` change
Class `att.placement` change
Class `att.dimensions` change

The following unused model classes are removed.

Class `model.certLike` delete
Class `model.egLike` delete
17.6 Summary of changes

Class model.entryPart delete
Class model.glossLike delete
Class model.oddDecl delete
Class model.offsetLike delete
Class model.pPart.msdesc delete
Class model.placeNamePart delete
Class model.placeStateLike delete
Class model.specDescLike delete

The following elements are modified by the TEI simplePrint specification, mostly by the addition of a processing model, but in other cases by additional constraints on the attributes they may have, or the values those attributes may take. Additional examples are also provided for some of them.
