Preface

This document is the formal specification for TEI simplePrint, an entry-level customization of the Text Encoding Initiative (TEI) Guidelines, intended to be generally useful to a large variety of encoders attempting to cope with the standardized representation of a variety of documents in digital form.

Like every other TEI customization, TEI simplePrint was designed for use with a particular type of material. If the material you are planning to encode matches the following criteria, then TEI simplePrint is for you. If it does not, it may not be.

- You are encoding print material, rather than manuscript: simplePrint provides no way of encoding manuscript features such as correction, deletion, or scribal variation
- You are encoding material from the Early Modern period (i.e., up to the end of the nineteenth century): some of the features for which simplePrint provides encodings are rarely found in modern materials.
- You are encoding material written, broadly speaking, within the Western European tradition, using largely Western European characters. simplePrint does provide facilities for encoding short passages in non Western European languages, but many features needed to cope with Asian or ancient scripts are missing.
- Your intention is to provide a relatively simple encoding for a large amount of material, rather than a rich encoding of a small amount of material: simplePrint is intended to help libraries and archives wishing to go beyond basic digital facsimiles, rather than to support specialist research. It does not, for example, include features for detailed linguistic tagging beyond simple word-level tagging, nor for specialised text types such as dictionaries, historical or biographical databases, etc.

If your needs go beyond those summarized here, simplePrint may still be a good point of departure, and may be very useful as a basis for the creation of your own TEI customisation. We don’t however discuss the creation of a TEI customization in this document: the TEI website provides a number of links to tutorial material and tools which may assist in this process.

The present document is intended to be generally comprehensible and accessible, but does assume some knowledge of XML (the encoding language used by the TEI), and of the way it is used by the TEI. Further information on both these topics are available from many places, not least the TEI’s own web site at http://www.tei-c.org.

The TEI simplePrint schema was first elaborated as a part of the TEI Simple project funded by the Andrew W. Mellon Foundation (2012-2014). The project sought to define a new highly-constrained and prescriptive subset of the Text Encoding Initiative (TEI) Guidelines suited to the representation of early modern print materials, a formally-defined set of processing rules which permit modern web applications to easily present and analyze the encoded texts, mapping to other ontologies, and processes to describe the encoding status and richness of a TEI digital text. Its choice of elements reflected the practices followed in the encoding of large-scale literary archives, notably those produced by the Text Creation Partnership. Practice of other comparable archives such as the German Text Archive was also taken into account.

The most distinctive feature of TEI simplePrint is its use of the TEI Processing Model, which provides explicit and recommended options for the display or processing of every textual element. Programmers developing systems to handle texts encoded with TEI simplePrint do not have to look beyond this when building stylesheets or other components. This greatly reduces the complexity of developing applications that will work reliably and consistently for many users and across large corpora of documents.

The TEI simplePrint schema and the TEI Processing Model were first defined by a working group led by Martin Mueller (Northwestern University) and Sebastian Rahtz (Oxford...
University). Major contributions to the project were made by Magdalena Turska (Oxford University), James Cummings (Oxford University), and Brian Pytlik Zillig. The changes to the TEI scheme needed to support the TEI Processing Model were reviewed and approved by the TEI Technical Council for inclusion in release 3.0.0 of TEI P5 in February 2016. The present document was extensively revised and extended by Lou Burnard in July 2016 for submission to the TEI Technical Council.
1 A Short Example

We begin with a short example. How should we go about transferring into a computer a passage of prose, such as the start of the last chapter of Charlotte Brontë's novel *Jane Eyre*? We might start by simply copying what we see on the printed page, typing it in such a way that what appears on the screen looks as similar as possible, for example, by retaining the original line breaks, by introducing blanks to represent the layout of the original headings, page breaks, and paragraphs, and so forth. Of course, the possibilities are limited by the nature of the computer program we use to capture the text: it may not be possible for example to reflect accurately the typographic characteristics of our source with all such software. Some characters in the printed text (such as the accented letter *a* in *faâl* or the long dash) may not be available on the keyboard; some typographic distinctions (such as that between small capitals and full capitals) may not be readily accessible. Our first attempt tries to mimic the appearance of the former, and simply ignores the latter.

CHAPTER 38

READER, I married him. A quiet wedding we had: he and I, the parson and clerk, were alone present. When we got back from church, I went into the kitchen of the manor-house, where Mary was cooking the dinner, and John cleaning the knives, and I said -- 'Mary, I have been married to Mr Rochester this morning.' The housekeeper and her husband were of that decent, phlegmatic order of people, to whom one may at any time safely communicate a remarkable piece of news without incurring the danger of having one's ears pierced by some shrill ejaculation and subsequently stunned by a torrent of wordy wonderment. Mary did look up, and she did stare at me; the ladle with which she was basting a pair of chickens roasting at the fire, did for some three minutes hang suspended in air, and for the same space of time John's knives also had rest from the polishing process; but Mary, bending again over the roast, said only -- 'Have you, miss? Well, for sure!' A short time after she pursued, 'I seed you go out with the master, but I didn't know you were gone to church to be wed'; and she basted away. John, when I turned to him, was grinning from ear to ear.

'I telled Mary how it would be,' he said: 'I knew what Mr Edward' (John was an old servant, and had known his master when he was the cadet of the house, therefore he often gave him his Christian name) -- 'I knew what Mr Edward would do; and I was certain he would not wait long either: and he's done right, for aught I know. I wish you joy, miss!' and he politely pulled his forelock.

'Thank you, John. Mr Rochester told me to give you and Mary this.'

I put into his hand a five-pound note. Without waiting to hear more, I left the kitchen. In passing the door of that sanctum some time after, I caught the words -- 'She'll happen do better for him nor ony o' t' grand ladies.' And again, 'If she ben't one o' th' handsomest, she's noan faâl, and varry good-natured; and i' his een she's fair beautiful, onybody may see that.'

I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and

474

JANE EYRE

475

Mary approved the step unreservedly. Diana announced that she
would just give me time to get over the honeymoon, and then she would come and see me.

'She had better not wait till then, Jane,' said Mr Rochester, when I read her letter to him; 'if she does, she will be too late, for our honey-moon will shine our life long: its beams will only fade over your grave or mine.'

How St John received the news I don't know: he never answered the letter in which I communicated it: yet six months after he wrote to me, without, however, mentioning Mr Rochester's name or alluding to my marriage. His letter was then calm, and though very serious, kind. He has maintained a regular, though not very frequent correspondence ever since: he hopes I am happy, and trusts I am not of those who live without God in the world, and only mind earthly things.

This transcription suffers from a number of shortcomings:

- the page numbers and running titles are intermingled with the text in a way which makes it difficult for software to distinguish them;

- no distinction is made between single quotation marks and apostrophe, so it is difficult to be certain exactly which passages are in direct speech;

- the preservation of the copy text's hyphenation means that simple-minded search programs will not find words broken across a line;

- the accented letter in faàl and the long dash have been rendered by ad hoc keying conventions (faa{l}) which follow no standard pattern and will be processed correctly only if the transcriber remembers to mention them in the documentation;

- paragraph divisions are marked only by the use of white space, and hard carriage returns have been introduced at the end of each line. Consequently, if the size of type used to display the text changes, reformatting will be problematic.

We now present the same passage, as it might be encoded in TEI simplePrint. As we shall see, there are many ways in which this encoding could be extended, but as a minimum, the TEI approach allows us to represent the following distinctions in a standardized way:

- Paragraph and chapter divisions are now marked explicitly by means of tags rather than implicitly by white space.

- Apostrophes are retained, but the quotation marks indicating direct speech have been removed, and direct speech is now marked explicitly by means of a tag.

- The accented letter and the long dash are accurately represented, using the appropriate Unicode character.

- Page divisions have been marked with an empty `<pb>` tag; the page heading and running text have been suppressed.

- The lineation of the original has also been suppressed and words broken by typographic accident at the end of a line have been re-assembled without comment.

- For convenience of proof reading, a new line has been introduced at the start of each paragraph, but the indentation is removed.
Reader, I married him. A quiet wedding we had: he and I, the parson and clerk, were
alone present. When we got back from church, I went into the kitchen of the
manor-house, where Mary was cooking the dinner, and John cleaning the knives,
and I said — 

Mary, I have been married to Mr Rochester this morning. The housekeeper
and her husband were of that decent, phlegmatic order of people, to whom one may at
any time safely communicate a remarkable piece of news without incurring the danger
of having one's ears pierced by some shrill ejaculation and subsequently stunned by
a torrent of wordy wonderment. Mary did look up, and she did stare at me; the ladle
with which she was basting a pair of chickens roasting at the fire, did for some
three minutes hang suspended in air, and for the same space of time John's knives
also had rest from the polishing process; but Mary, bending again over the roast,
said only — 

Have you, miss? Well, for sure! 

A short time after she pursued, I seed you go out with the master, but I didn't
know you were gone to church to be wed; and she basted away. John, when I
turned to him, was grinning from ear to ear. I telled Mary how it would be,
he said: I knew what Mr Edward (John was an old servant, and had known
his master when he was the cadet of the house, therefore he often gave him his Christian
name) — I knew what Mr Edward would do; and I was certain he would not wait
long either: and he's done right, for aught I know. I wish you joy, miss! 

Thank you, John. Mr Rochester told me to give you and Mary this. 

I put into his hand a five-pound note. Without waiting to hear more, I left the
kitchen. In passing the door of that sanctum some time after, I caught the words
—

She'll happen do better for him nor ony o' t' grand ladies. And again,
If she ben't one o' th' handsomest, she's noan faàl, and varry good-natured; and i'
his een she's fair beautiful, anybody may see that.

I wrote to Moor House and to Cambridge immediately, to say what I had done:
fully explaining also why I had thus acted. Diana and Mary approved the step
unreservedly. Diana announced that she would just give me time to get over the
honeymoon, and then she would come and see me.
She had better not wait till then, Jane," said Mr Rochester, when I read her letter to him; "if she does, she will be too late, for our honeymoon will shine our life long: its beams will only fade over your grave or mine."

How St John received the news I don’t know: he never answered the letter in which I communicated it: yet six months after he wrote to me, without, however, mentioning Mr Rochester’s name or alluding to my marriage. His letter was then calm, and though very serious, kind. He has maintained a regular, though not very frequent correspondence ever since: he hopes I am happy, and trusts I am not of those who live without God in the world, and only mind earthly things.

This encoding is expressed in TEI XML, a very widely used and standardized method of representing information about a document within the document itself. The transcribed words are complemented by special flags within angle brackets, called tags, which both characterise and mark the beginning and end of a string of characters. For example, each paragraph is marked by a tag <p> at its start, and a corresponding </p> at its end. We don’t elaborate further on the syntax of TEI XML here.  

Aside from its syntax, it is important to note that this particular encoding represents a set of choices or priorities. We have chosen to prioritize and simplify the representation of the words of the text over the representation of the typographic layout associated with them in this source document. This makes it easier for a computer to answer questions about the words in the document than about its typesetting, reflecting our research priorities. This priority also leads us to suppress end-of-line hyphenation. Conceivably Brontë (or her printer) intended the word honeymoon to appear as honey-moon on its second appearance, though this seems unlikely: our decision to focus on Brontë’s text, rather than on the printing of it in this particular edition, makes it impossible to be certain. Similarly, our decision makes it impossible to use this transcription as a means of statistically analysing hyphenation practice. An encoding makes explicit all and only those textual features of importance to the encoder.

It is not difficult to think of ways in which the encoding of even this short passage might readily be extended to address other research priorities. For example:

- a regularized form of the passages in dialect could be provided;
- footnotes glossing or commenting on any passage could be added;
- pointers linking parts of this text to others could be added;
- proper names of various kinds could be distinguished from the surrounding text;
- names could be classified as personal, geographical, or institutional;
- detailed bibliographic information about the text’s provenance and context could be prefixed to it;
- a linguistic analysis of the passage into sentences, clauses, words, etc., could be provided, each unit being associated with appropriate category codes;

---

1Many introductory tutorials on XML are available on the web, for example at http://www.w3schools.com/xml/. The way the TEI uses XML is fully documented in section v of the TEI Guidelines; a very basic introduction to TEI XML is also available at http://www.ultraslavonic.info/intro-to-xml. The formal specification of the XML language is at http://www.w3.org/TR/xml.
• the text could be segmented into narrative or discourse units;
• systematic analysis or interpretation of the text could be included in the encoding, with potentially complex alignment or linkage between the text and the analysis, or between the text and one or more translations of it;
• passages in the text could be linked to images or sound held on other media.

In the remainder of this document, we present a number of TEI-recommended ways of supporting these and other encoding requirements. These ways generally involve the application of specific TEI XML elements, selected from the full range of possibilities documented in the TEI Guidelines. Like every other TEI project, TEI Simple proposes a view of the TEI Guidelines. This document defines and documents that view.

2 The Structure of a TEI simplePrint Document

A TEI-conformant text contains (a) a TEI header (marked up as a `<teiHeader>` element) and (b) one or more representations of a text. These representations may be of three kinds: a transcribed text, marked up as a `<text>` element; a collection of digital images representing the text, marked up using a `<facsimile>` element; or a literal transcription of one or more documents instantiating the text, marked up using the `<sourceDoc>` element.

These elements are combined together to form a single `<TEI>` element, which must be declared within the TEI namespace, and therefore usually takes the form `<TEI xmlns="http://www.tei-c.org/ns/1.0">`.

Some aspects of the TEI header are described in more detail in section 15. The Electronic Title Page. In what follows, we will focus chiefly on the use of the `<text>` element, though we describe one way of using the `<facsimile>` element in combination with it or alone in section 14. Encoding a Digital Facsimile. We do not consider the `<sourceDoc>` element further, since it is mainly used in very specialised applications for which TEI simplePrint would not be appropriate.

A text may be unitary (a single work) or composite (a collection of single works, such as an anthology). In either case, the text may have optional front or back matter such as title pages, prefaces, appendixes etc. We use the term body for whatever comes between these in the source document. We discuss various kinds of composite text in section 12. Composite and Floating Texts below.

A unitary text will be encoded using an overall structure like this:

```xml
<TEI xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!-- [ TEI Header information ] -->
  </teiHeader>
  <text>
    <front>
      <!-- [ front matter ... ] -->
    </front>
    <body>
      <!-- [ body of text ... ] -->
    </body>
    <back>
      <!-- [ back matter ... ] -->
    </back>
  </text>
</TEI>
```

2A namespace is an XML concept. Its function is to identify the vocabulary from which a group of element names are drawn, using a standard identifier resembling a web address. The namespace for TEI elements is http://www.tei-c.org/ns/1.0
3 Encoding the Body

In each of the following sections we include a short list of the TEI elements under discussion, along with a brief description, and in most cases an example of how they are used. Throughout the text, element names are linked to their detailed reference documentation, as given in the TEI Guidelines. Note that most of the examples provided by the reference documentation, and all of the links, are not specific to TEI simplePrint.

For example, here are the elements discussed so far:

- **<TEI>** (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the model.resource class. Multiple **<TEI>** elements may be combined within a **<TEI>** (or **<teiCorpus>**) element.
- **<teiHeader>** (TEI header) supplies descriptive and declarative metadata associated with a digital resource or set of resources.
- **<text>** (text) contains a single text of any kind, whether unitary or composite, for example a poem or drama, a collection of essays, a novel, a dictionary, or a corpus sample.
- **<facsimile>** contains a representation of some written source in the form of a set of images rather than as transcribed or encoded text.

3 Encoding the Body

As indicated above, a unitary text is encoded by means of a **<text>** element, which may contain the following elements:

- **<front>** (front matter) contains any prefatory matter (headers, abstracts, title page, prefaces, dedications, etc.) found at the start of a document, before the main body.
- **<group>** (group) contains the body of a composite text, grouping together a sequence of distinct texts (or groups of such texts) which are regarded as a unit for some purpose, for example the collected works of an author, a sequence of prose essays, etc.
- **<body>** (text body) contains the whole body of a single unitary text, excluding any front or back matter.
- **<back>** (back matter) contains any appendixes, etc. following the main part of a text.

Elements specific to front and back matter are described below in section 13. Front and Back Matter. In this section we discuss the elements making up the body of a text. A text must always have a body.

3.1 Text Division Elements and Global Attributes

The body of a prose text may be just a series of paragraphs or similar blocks of text, or these may be grouped together into chapters, sections, subsections, etc. The **<div>** element is used to represent any such grouping of blocks.

- **<div>** (text division) contains a subdivision of the front, body, or back of a text.
  - @type [att.typed] characterizes the element in some sense, using any convenient classification scheme or typology.

  The type attribute on the **<div>** element may be used to supply a conventional name for this category of text division in order to distinguish them. Typical values might be book, chapter, section, part, poem, song, etc. TEI simplePrint does not constrain the range of values that may be used here.

  A **<div>** element may itself contain further, nested, **<div>**s, thus mimicking the traditional structure of a book, which can be decomposed hierarchically into units such as parts, containing chapters, containing sections, and so on. TEI texts in general conform to this simple hierarchic model.

  Here as elsewhere the xml:id attribute may be used to supply a unique identifier for the division, which may be used for cross references or other links to it, such as a commentary, as further discussed in section 3.7. Cross References and Links. It is good practice to provide
an \textit{xml:id} attribute for every major structural unit in a text, and to derive its values in some systematic way, for example by appending a section number to a short code for the title of the work in question, as in the examples below.

The \textit{n} attribute may be used to supply (additionally or alternatively) a short mnemonic name or number for a division, or any other element. If a conventional form of reference or abbreviation for the parts of a work already exists (such as the book/chapter/verse pattern of Biblical citations), the \textit{n} attribute is the place to record it; unlike the identifier supplied by the \textit{xml:id} attribute, it does not need to be unique.

The \textit{xml:lang} attribute may be used to specify the language of the division. Languages are identified by an internationally defined code, as further discussed in section \ref{sec:xml:lang}. \textit{Foreign Words or Expressions} below.

The \textit{rendition} attribute may be used to supply information about the rendition (appearance) of a division, or any other element, as further discussed in section \ref{sec:rendition}. \textit{Marking Highlighted Phrases} below. Note that this attribute is used to describe the appearance of the source text, rather than the appearance of any intended output when the encoded text is displayed. The two may of course be similar, or identical, but the TEI does not assume or require this.

These four attributes, \textit{xml:id}, \textit{n}, \textit{xml:lang}, and \textit{rendition} are so widely useful that they are allowed on any element in any TEI schema: they are called \textit{global attributes}. Other attributes defined in the TEI simplePrint schema are discussed in section \ref{sec:simplePrint}. \textit{Special Kinds of Linking}.

As noted above, the value of every \textit{xml:id} attribute must be unique within a document. One simple way of ensuring this is to make it reflect the hierarchic structure of the document. For example, Smith’s \textit{Wealth of Nations} as first published consists of five books, each of which is divided into chapters, while some chapters are further subdivided into parts. We might define \textit{xml:id} values for this structure as follows:

```xml
<body>
  <div xml:id="WN1" n="I" type="book">
    <div xml:id="WN101" n="I.1" type="chapter">
      <!-- ... -->
    </div>
    <div xml:id="WN102" n="I.2" type="chapter">
      <!-- ... -->
    </div>
    <!-- ... -->
  </div>
  <div xml:id="WN2" n="II" type="book">
    <!-- ... -->
  </div>
</body>
```

A different numbering scheme may be used for \textit{xml:id} and \textit{n} attributes: this is often useful where a canonical reference scheme is used which does not tally with the structure of the work. For example, in a novel divided into books each containing chapters, where the chapters are
numbered sequentially through the whole work, rather than within each book, one might use a scheme such as the following:

```xml
<body>
  <div xml:id="TS01" n="1" type="volume">
    <div xml:id="TS011" n="1" type="chapter">
      <!-- ... -->
    </div>
    <div xml:id="TS012" n="2" type="chapter">
      <!-- ... -->
    </div>
  </div>
  <div xml:id="TS02" n="2" type="volume">
    <div xml:id="TS021" n="3" type="chapter">
      <!-- ... -->
    </div>
    <div xml:id="TS022" n="4" type="chapter">
      <!-- ... -->
    </div>
  </div>
</body>
```

Here the work has two volumes, each containing two chapters. The chapters are numbered conventionally 1 to 4, but the \textit{xml:id} values specified allow them to be regarded additionally as if they were numbered 1.1, 1.2, 2.1, 2.2.

### 3.2 Headings and Closings

Every \textit{div} may have a title or heading at its start, and (less commonly) a trailer such as \textit{End of Chapter 1} at its end. The following elements may be used to transcribe them:

- \textit{head} \textit{(heading)} contains any type of heading, for example the title of a section, or the heading of a list, glossary, manuscript description, etc.
- \textit{trailer} contains a closing title or footer appearing at the end of a division of a text.

Some other elements which may be found at the beginning or ending of text divisions are discussed below in section \cite[13.1.2. Prefatory Matter]{footnote}.

Whether or not headings and trailers are included in a transcription is a matter for the individual transcriber to decide. Where a heading is completely regular (for example Chapter 1) or may be automatically constructed from attribute values (e.g. \textit{<div type="chapter" n="1">}), it may be omitted; where it contains otherwise unrecoverable text it should always be included. For example, the start of Hardy’s \textit{Under the Greenwood Tree} might be encoded as follows:

```xml
<div xml:id="UGT1" n="Winter" type="part">
  <div xml:id="UGT101" n="1" type="chapter">
    <head>Mellstock-Lane</head>
    <p>To dwellers in a wood almost every species of tree ...</p>
  </div>
</div>
```

### 3.3 Textual Components

In prose texts such as the Brontë example above, the divisions are generally composed of paragraphs, represented as \textit{<p>} elements, though in some circumstances it may be preferred to use the anonymous block element \textit{<ab>}. In poetic or dramatic texts different elements are used, representing stanzas and verse lines in the first case, and individual speeches or stage directions in the second:

- \textit{<p>} \textit{(paragraph)} marks paragraphs in prose.
3.3 Textual Components

<ab> (anonymous block) contains any component-level unit of text, acting as a container for phrase or inter level elements analogous to, but without the same constraints as, a paragraph.

<l> (verse line) contains a single, possibly incomplete, line of verse.

<lg> (line group) contains one or more verse lines functioning as a formal unit, e.g. a stanza, refrain, verse paragraph, etc.

<sp> (speech) contains an individual speech in a performance text, or a passage presented as such in a prose or verse text.

<speaker> contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<stage> (stage direction) contains any kind of stage direction within a dramatic text or fragment.

We discuss each of these kinds of component separately below.

3.3.1 Verse

Here, for example, is the start of a poetic text in which verse lines and stanzas are tagged:

```xml
<lg n="I">
  <l>I Sing the progresse of a deathlesse soule,</l>
  <l>Whom Fate, with God made, but doth not controule,</l>
  <l>... ... ...</l>
  <l>A worke t'out weare Seths pillars, bricke and stone,</l>
  <l>And (holy writs excepted) made to yeeld to none,</l>
</lg>
```

Note that the `<l>` element marks verse lines, not typographic lines: as elsewhere the original lineation of the source text is not therefore preserved by this encoding. The `<lb>` element described in section 3.4. Page and Line Numbers might additionally be used to mark typographic lines if so desired.

In a poetic text it may also be considered useful to identify the rhymes, for which the following element may be used:

`<rhyme>` marks the rhyming part of a metrical line.

`@label` provides a label (usually a single letter) to identify which part of a rhyme scheme this rhyming string instantiates.

The following example shows how this element might be used both to identify rhyming words or word parts and to assign each rhyme to a part of a rhyming pattern by means of its `label` attribute. The rhyming pattern here is specified by the `rhyme` attribute supplied on the `<lg>` representing the stanza within which the pattern operates:

```xml
<lg rhyme="AABCCBBA">
  <l>The sunlight on the <rhyme label="A">garden</rhyme></l>
  <l>Harden</l>
  <l>We cannot cage the <rhyme label="C">minute</rhyme></l>
  <l>thin it</l>
  <l>When all is <rhyme label="B">told</rhyme></l>
  <l>We cannot beg for <rhyme label="A">pardon</rhyme>.</l>
</lg>
```
3 ENCODING THE BODY

The rhyme attribute may be used independently of the <rhyme> element, or in combination with it, as above.

3.3.2 Drama
A dramatic text contains speeches, which may be in prose or verse, and will also contain stage directions. The <sp> element is used to represent each identified speech. It contains an optional speaker indication, marked with the <speaker> element, which can be followed by one or more <l> or <p> elements, depending on whether the speech is considered to be in prose or in verse. Stage directions, whether within or between speeches, are marked using the <stage> element.

For example:

```
<sp>
  <speaker>Vladimir</speaker>
  <p>Pull on your trousers.</p>
</sp>

<sp>
  <speaker>Estragon</speaker>
  <p>You want me to pull off my trousers?</p>
</sp>

<sp>
  <speaker>Vladimir</speaker>
  <p>Pull <hi>on</hi> your trousers.</p>
</sp>

<sp>
  <speaker>Vladimir</speaker>
  <p>(realizing his trousers are down)</p>
  <stage>. True</stage>
</sp>

<stage>He pulls up his trousers</stage>

<sp>
  <speaker>Vladimir</speaker>
  <p>Well? Shall we go?</p>
</sp>

<sp>
  <speaker>Estragon</speaker>
  <p>Yes, let's go.</p>
</sp>

<stage>They do not move.</stage>
```

In a verse drama, it is quite common to find that verse lines are split between speakers. The easiest way of encoding this is to use the part attribute to indicate that the lines so fragmented are incomplete:

```
<div type="Act" n="I">
  <head>ACT I</head>
  <div type="Scene" n="1">
    <head>SCENE I</head>
    <stage rendition="#italic">Enter Barnardo and Francisco, two Sentinels, at several doors</stage>
    <sp>
      <speaker>Barn</speaker>
      <l part="Y">Who's there?</l>
    </sp>
    <sp>
      <speaker>Fran</speaker>
      <l>Nay, answer me. Stand and unfold yourself.</l>
    </sp>
  </div>
</div>
```
The value of the part attribute may indicate just that the element bearing is fragmented in some (unspecified) respect rather than a complete verse line (part="Y"); alternatively it may indicate whether this is an initial (I), medial (M) or F (final) fragment.

The same mechanism may be applied to stanzas which are divided between two speakers:

The `<sp>` element can also be used for dialogue presented in a prose work as if it were drama, as in the next example, which also demonstrates the use of the who attribute to bear a code identifying the speaker of the piece of dialogue concerned:
On the contrary, sir, I think there is much to be said for him. In the first place....</p>

Fish, Miss Gryll -- I could discorse to you on fish by the hour: but for the present I will forbear.</p>

Here the who attribute values (#OPI etc.) are links, pointing to items in a list of the characters in the novel. In the case of a play, this list of characters might appear in the original source as a cast list or dramatic personae, which might be marked up using the <castList> element described in section 13.2.2. Specialized Front and Back Matter below. Such a list would not, of course, be appropriate to provide descriptive information about each character, much of which does not appear in the original source. Instead a <particDesc> (participant description) element should be provided in the TEI header, as further discussed in section 15.3. The Profile Description below.

3.3.3 Other Kinds of Text Block

As mentioned above, the <ab> element may also be used in preference to the <p> element. It should be used for blocks of text which are not clearly paragraphs, verse lines, or dramatic speeches. Typical examples include the canonical verses of the Bible, and the textual blocks of other ancient documents which predate the invention of the paragraph, such as Greek inscriptions or Egyptian hieroglyphs. The element is also useful as a means of encoding more specialized kinds of textual block, such as the question and answer structure of a catechism, or the highly formalized substructure of a legal document (if <div> is not considered appropriate for these). In more modern documents, it can be used to encode semi-organized or fragmentary materials such as an artist’s notebook or work in progress; or to faithfully capture the substructure of a file produced by an OCR system.

3.4 Page and Line Numbers

Page and line breaks etc. may be marked with the following elements:

- `<pb>` (page beginning) marks the beginning of a new page in a paginated document.
- `<lb>` (line beginning) marks the beginning of a new (typographic) line in some edition or version of a text.
- `<cb>` (column beginning) marks the beginning of a new column of a text on a multi-column page.
- `<milestone>` (milestone) marks a boundary point separating any kind of section of a text, typically but not necessarily indicating a point at which some part of a standard reference system changes, where the change is not represented by a structural element.
- `<fw>` (forme work) contains a running head (e.g. a header, footer), catchword, or similar material appearing on the current page.

The `<pb>`, `<lb>`, and `<cb>` elements are special cases of a general class of elements known as milestones because they mark reference points within a text. The generic `<milestone>` element can mark any kind of reference point: for example, a column break, the start of a new kind of section not otherwise tagged, a change of author or style, or in general any significant change in the text not enclosed by an XML element. Unlike other elements, milestone elements do not enclose a piece of text and make an assertion about it; instead they indicate a point in the text where something changes, as indicated by a change in the values of the milestone’s attributes unit, which indicates the something concerned, and n which indicates the new value.

The `<pb>`, `<lb>`, and `<cb>` elements are shortcuts or syntactic sugar for `<milestone unit="page"/>` `<milestone unit="line"/>` and `<milestone unit="column"/>` respectively.
When working from a paginated original, it is often useful to record its pagination, whether to simplify later proof-reading, or to align the transcribed text with a set of page images, as further discussed below.

Because `<pb>` and other milestone elements are empty, they may be placed freely within or between other elements. However, it is recommended practice always to put them at the beginning of whatever unit it is that their presence implies, and not to nest them within elements contained by that unit. For example, in the following example a page break occurs between two lines of a poem:

```xml
<l>Mary had a little lamb</l>
<pb n="13"/>
<l>Its fleece was white as snow</l>
```

The `<pb>` element should be placed ahead of all the text encoded on the 13th page. Contrast this with the following less accurate encoding:

```xml
<l>Mary had a little lamb</l>
<l>
<pb n="13"/>Its fleece was white as snow
</l>
```

This is less accurate because it implies that the second verse line actually begins before the page break.

Similar considerations apply to line breaks (`<lb>`), though these are less frequently considered useful when encoding modern printed textual sources. When transcribing manuscripts or early printed books, however, it is often helpful to retain them in an encoding, if only to facilitate alignment of transcription and original. Like `<pb>`, the `<lb>` element should appear before the text of the line whose start it signals.

If features such as pagination or lineation are marked for more than one edition, the edition in question may be specified by the `ed` attribute. For example, in the following passage we indicate where the page breaks occur in two different editions (ED1 and ED2):

```xml
<p>I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and <pb ed="ED1" n="475"/> Mary approved the step unreservedly. Diana announced that she would <pb ed="ED2" n="485"/> just give me time to get over the honeymoon, and then she would come and see me.</p>
```

When transcribing from a paginated source, the encoder must decide whether to suppress such features as running titles, page signatures, catch words etc., to replace them by a simplified representation using the `<pb>` element, perhaps using the `n` attribute to preserve some of the information, or to preserve them entirely using the `<fw>` element. The latter strategy is appropriate in encodings which aim to retain as much information as possible about the original typography; it will however make more complex the processing of the source for other purposes, as in the following example:

```xml
<l>He also fix'd the wandering QUEEN OF NIGHT</l>
<fw type="sig">Ii 2</fw>
<fw type="catch">Whether</fw>
<pb n="244"/>
<l>Whether she wanes into a scanty orb...</l>
<!-- Thomson, Seasons, 1730-->
```
3 ENCODING THE BODY

The `<pb>` element is also used to align parts of a transcription with a digital image of the page concerned. This may be done in a very simple but inflexible way by using the `facs` attribute to point to each page image concerned:

```xml
<p>I wrote to Moor House and to Cambridge immediately, to say what I had done: fully explaining also why I had thus acted. Diana and <pb ed="ED1" n="475" facs="edip475.png"/> Mary approved the step unreservedly... </p>
```

The `facs` attribute can supply (as here) a filename, or any other form of URI, if for example the page image is stored remotely. One drawback of this simplistic approach is that there must be exactly one image file per page of text. It is not therefore suitable in the case where the available page images represent double page spreads, or where there are multiple images of the same page (for example at different resolutions).

A more powerful approach, discussed in section 14. Encoding a Digital Facsimile below, is to use the `<facsimile>` element to define the organisation of the set of images representing the text, and then use the `facs` attribute to point to individual components of that representation.

3.5 Marking Highlighted Phrases

3.5.1 Changes of Typeface, etc.

Highlighted words or phrases are those made visibly different from the rest of the text, typically by a change of type font, handwriting style, ink colour etc., which is intended to draw the reader’s attention to some associated change.

The global `rendition` attribute can be attached to any element, and used wherever necessary to specify details of the highlighting used for it in the source. For example, a heading rendered in bold might be tagged `<head rendition="simple:bold"`>, and one in italic `<head rendition="simple:italic"`>.

The values used for the `rendition` attribute point to definitions provided for the formatting concerned. These definitions are typically provided by a `<rendition>` element in the document’s header, as further discussed in section 15.2.3. Tagging Declaration.

It is not always possible or desirable to interpret the reasons for such changes of rendering in a text. In such cases, the element `<hi>` may be used to mark a sequence of highlighted text without making any claim as to its status. `<hi>` (highlighted) marks a word or phrase as graphically distinct from the surrounding text, for reasons concerning which no claim is made.

In the following example, the use of a distinct typeface for the subheading and for the included name are recorded but not interpreted:

```xml
<p>
<hi rendition="simple:blackletter">And this Indenture further witnesseth</hi> that the said <hi rendition="simple:italic">Walter Shandy</hi>, merchant, in consideration of the said intended marriage ...
</p>
```

Alternatively, where the cause for the highlighting can be identified with confidence, a number of other, more specific, elements are available.

`<foreign>` (foreign) identifies a word or phrase as belonging to some language other than that of the surrounding text.

`<label>` (label) contains any label or heading used to identify part of a text, typically but not exclusively in a list or glossary.

`<title>` (title) contains a title for any kind of work.
3.5 Marking Highlighted Phrases

Some features (notably quotations, titles, and foreign words) may be found in a text either marked by highlighting, or with quotation marks. In either case, the element `<q>` (as discussed in the following section) should be used. Again, the global *rendition* attribute can be used to record details of the highlighting used in the source if this is thought useful.

As an example of the elements defined here, consider the following sentence: On the one hand the *Nibelungenlied* is associated with the new rise of romance of twelfth-century France, the *romans d’antiquité*, the romances of Chrétien de Troyes, and the German adaptations of these works by Heinrich van Veldeke, Hartmann von Aue, and Wolfram von Eschenbach. Interpreting the role of the highlighting, the sentence might be encoded as follows:

```xml
<p>On the one hand the <title>Nibelungenlied</title> is associated with the new rise of romance of twelfth-century France, the <foreign>romans d’antiquité</foreign>, the romances of Chrétien de Troyes, ...</p>
```

Describing only the appearance of the original, it might be encoded like this:

```xml
<p>On the one hand the <hi rendition="simple:italic">Nibelungenlied</hi> is associated with the new rise of<br>romance of twelfth-century France, the <hi rendition="simple:italic">romans d’antiquité</hi>, the romances of<br>Chrétien de Troyes, ...</p>
```

3.5.2 Quotations and Related Features

Like changes of typeface, quotation marks are conventionally used to denote several different features within a text, of which the most frequent is quotation, though many other features are possible. The full TEI Guidelines provide additional elements such as `<mentioned>` or `<said>` to distinguish some of these features, but these more specialised elements are not included in TEI simplePrint. In TEI Simple however, we use the `<quote>` element for quotation only, and the `<q>` element for all other material found within quotation marks in the text.

`<q>` (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

`<quote>` (quotation) contains a phrase or passage attributed by the narrator or author to some agency external to the text.

Here is a simple example of a quotation:

```xml
<p>Few dictionary makers are likely to forget Dr. Johnson’s description of the lexicographer as <quote>a harmless drudge.</quote></p>
```

As elsewhere, the way that a citation or quotation was printed (for example, *in-line* or set off as a *display* or *block quotation*), may be represented using the *rendition* attribute. This may also be used to indicate the kind of quotation marks used.

Direct speech interrupted by a narrator can be represented simply by ending the `<q>` element and beginning it again after the interruption, as in the following example:
<p>Who-e debel you?</p> — he at last said — <q>you no speak-e, damme, I kill-e.</q> And so saying, the lighted tomahawk began flourishing about me in the dark.

If it is important to convey the idea that the two <q> elements together make up a single speech, the linking attributes <i>next</i> and <i>prev</i> may be used, as described in section 3.7.3. <i>Special Kinds of Linking</i>.

Direct speech may be accompanied by a reference to the source or speaker, using the <i>who</i> attribute, whether or not this is explicit in the text, as in the following example:

<q who="#Wilson">Spaulding, he came down into the office just this day eight weeks with this very paper in his hand, and he says:--<q who="#Spaulding">I wish to the Lord, Mr. Wilson, that I was a red-headed man.</q></q>

This example also demonstrates how quotations may be embedded within other quotations: one speaker (Wilson) quotes another speaker (Spaulding).

The creator of the electronic text must decide whether quotation marks are replaced by the tags or whether the tags are added and the quotation marks kept. If the quotation marks are removed from the text, the <i>rendition</i> attribute may be used to record the way in which they were rendered in the copy text.

3.5.3 Foreign Words or Expressions

Words, phrases, or longer stretches of text that are not in the main language of the texts may be tagged as such in one of two ways. The global <i>xml:lang</i> attribute may be attached to any element to show that it uses some other language than that of the surrounding text. Where there is no applicable element, the element <foreign> may be used, again using the <i>xml:lang</i> attribute. For example:

<p>John has real <foreign xml:lang="fr">savoir-faire</foreign>.</p>
<p>Have you read <title xml:lang="de">Die Dreigroschenoper</title>?</p>

As these examples show, the <foreign> element should not be used to tag foreign words if some other more specific element such as <title>, or <div> applies.

The value of the <i>xml:lang</i> attribute on an element applies hierarchically to everything contained by that element, unless overridden:

<div xml:lang="la">
<p>Pars haec Latine composita est.</p>
<p xml:lang="en">Except that this sentence is in English.</p>
<p>Vita brevis, ars longa.</p>
</div>

Here we specify that the whole <div> element uses the language with the coded identifier la i.e., Latin. Since it is contained by that <div> there is no need to supply this information again for the first <s> element. The second <s> element however overrides this value, and indicates that its content is in English (the language with identifier en). The third <s> element is again in Latin.
The codes used to identify languages, supplied on the xml:lang attribute, are defined by an international standard\(^3\), as further explained in the relevant section of the TEI Guidelines. Some simple example codes for a few languages are given here:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>zh</td>
<td>Chinese</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
<tr>
<td>enm</td>
<td>Middle English</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>grc</td>
<td>Ancient Greek</td>
</tr>
<tr>
<td>ja</td>
<td>Japanese</td>
</tr>
<tr>
<td>la</td>
<td>Latin</td>
</tr>
<tr>
<td>sa</td>
<td>Sanskrit</td>
</tr>
</tbody>
</table>

3.6 Notes

A note is any additional comment found in a text, marked in some way as being out of the main textual stream. A note is always attached to some part of the text, implicitly or explicitly: we call this its target, or its point of attachment. The element <note> should be used to mark any kind of note whether it appears as a separate block of text in the main text area, at the foot of the page, at the end of the chapter or volume, in the margin, or in some other place.

<note> (note) contains a note or annotation.

Notes may be in a different hand or typeface, may be authorial or editorial, and may have been added later. The attributes type and resp can be used to distinguish between different kinds of notes or identify their authors.

In a printed or written text, the point of attachment for a note is typically represented by a siglum such as an alphanumerical or other character, often in superscripted form. When encoding such a text, it is conventional to replace this siglum by a note element containing the annotation itself, as in the following example:

```xml
<p>...some text <note xml:id="n6">a note about some text</note> .... </p>
```

An alternative approach is to encode the point of attachment wherever it appears in the text, using for example the <ref> element discussed in the next section, and to place the <note> element anywhere convenient. The two can then be associated by using the target attribute on the <ref> element to point to the <note> element, as in the following example, in which the superscripted 7 indicating the point of attachment has been retained as part of the encoding:

```xml
<p>...some text <ref target="#n7" rendition="simple:superscript">7</ref> .... <note xml:id="n7">a note about some text</note> </p>
```

It may however be problematic to determine the precise position of the point of attachment, particularly in the case of marginal notes. A marginal note may also be hard to distinguish from a label or subheading which introduces the text with which it is associated. Where the purpose of the note is clearly to label the associated text, rather than to comment on it, the element <label> may be preferable. Where it is clearly a subheading attached to a distinct subdivision, it may be preferable to start a new element <div> and encode the subheading as a <head>.

\(^3\)The relevant Internet standard is Best Current Practice 47 (http://tools.ietf.org/html/bcp47). The authoritative list of registered subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry. For a general overview of the construction of language tags, see http://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see http://www.w3.org/International/questions/qa-choosing-language-tags.
Note however that a `<head>` cannot be inserted anywhere except at the beginning of a `<div>`. And where (as in some Early Modern English plays) marginal annotation is systematically used to identify speakers, it may be better to represent these using the `<speaker>` element introduced above. In cases of doubt, the encoder should decide on a clear policy and preferably document it for the use of others.

### 3.7 Cross References and Links

Any kind of cross reference or link found at one point in a text which points to another part of the same or another document may be encoded using the `<ref>` element discussed in this section. Implicit links (such as the association between two parallel texts, or that between a text and its interpretation) may be encoded using the linking attributes discussed in section 3.7.3. *Special Kinds of Linking*.

#### 3.7.1 Simple Cross References

`<ref>` (reference) defines a reference to another location, possibly modified by additional text or comment.

Usually, the presence of a cross-reference or link will be indicated by some text or symbol in the source being encoded, which will then become the content of the `<ref>` element. Occasionally, however, and frequently in the case of a born digital document, the exact form and appearance of the cross reference text will be determined dynamically by the software processing the document. In such cases, the `<ref>` element will have no content, and serve simply to mark a point from which a link is to be made, along with the target of the link.

The following two forms, for example, are logically equivalent:

```
See especially <ref target="#SEC12">section 12 on page 34</ref>.
```

In both cases, there is a cross reference from the position in the source document immediately following the word *especially* to whatever element in the encoded document has the identifier SEC12. In the first case, the encoder has supplied the original form of the cross reference section 12 on page 34; in the second, the task of generating an appropriate form of cross reference has been left to the formatting software. Perhaps the pagination and section numbers of the document in question are not yet determined; perhaps the cross reference should be replaced by a big red button. In either case, however, the value of the `target` attribute must be the identifier of some other element within the current document. Since the passage or phrase being pointed at must bear an identifier, it must be an element of some kind. In the following example, the cross reference is to a `<div>` element:

```
... see especially <ref target="#SEC12">./.

...<div xml:id="SEC12">
  <head>Concerning Identifiers</head>
</div>
```

Because the `xml:id` attribute is global, any element in a TEI document may be pointed to in this way. In the following example, a paragraph has been given an identifier so that it may be pointed at:

```
... see especially <ref target="#SEC12"/>.
```
3.7 Cross References and Links

Sometimes the target of a cross reference does not correspond with any particular feature of a text, and so may not be tagged as an element of some kind. If the desired target is simply a point in the current document, the easiest way to mark it is by introducing an `<anchor>` element at the appropriate spot. If the target is some sequence of words not otherwise tagged, the `<seg>` element may be used to mark them. These two elements are described as follows:

- `<anchor>` (anchor point) attaches an identifier to a point within a text, whether or not it corresponds with a textual element.
- `<seg>` (arbitrary segment) represents any segmentation of text below the chunk level.

In the following example, `<ref>` elements have been used to represent points in this text which are to be linked in some way to other parts of it; in the first case to a point, and in the second, to a sequence of words:

Returning to `<ref target="#ABCD">the point where I dozed off</ref>`, I noticed that `<ref target="#EFGH">three words</ref>` had been circled in red by a previous reader.

This encoding requires that elements with the specified identifiers (ABCD and EFGH in this example) are to be found somewhere else in the current document. Assuming that no element already exists to carry these identifiers, the `<anchor>` and `<seg>` elements may be used:

```xml
.... <anchor type="bookmark" xml:id="ABCD"/> .... ....<seg type="target" xml:id="EFGH">
... </seg> ...
```

The `type` attribute should be used (as above) to distinguish amongst different purposes for which these general purpose elements might be used in a text. Some other uses are discussed in section 3.7.3. Special Kinds of Linking below.

3.7.2 Pointing to other documents

So far, we have shown how the `<ref>` element may be used for cross-references or links whose targets occur within the same document as their source. The element may also be used to refer to elements in any other XML document or resource, such as a document on the web, or a database component. This is possible because the value of the `target` attribute may be any valid Uniform Resource Identifier (URI).

A URI may reference a web page or just a part of one, for example http://www.tei-c.org/index.xml#SEC2. The hash sign indicates that what follows it is the identifier of an element to be located within the XML document identified by what precedes it: this example will therefore locate an element which has an `xml:id` attribute value of SEC2 within the document retrieved from http://www.tei-c.org/index.xml. In the examples we have discussed so far, the part to the left of the sharp sign has been omitted: this is understood to mean that the referenced element is to be located within the current document.

It is also possible to define an abbreviated form of the URI, using a predefined `prefix` separated from the rest of the code by a colon, as for example cesr:SEC2. This is known as a private URI.

---

4A full definition of this term, defined by the W3C (the consortium which manages the development and maintenance of the World Wide Web), is beyond the scope of this tutorial: however, the most frequently encountered version of a URI is the familiar URL used to indicate a web page, such as http://www.tei-c.org/index.xml
since the prefix is not standardized (except that the prefix xml: is reserved for use by XML itself). A \texttt{<prefixDef>\ldots</prefixDef>} element should be supplied within the TEI header specifying how the prefix (here cesr) should be translated to give a full URL for the link. This is particularly useful if a document contains many references to an external document such as an authority file.

Parts of an XML document can be specified by means of other more sophisticated mechanisms using a language called Xpointer, also defined by the W3C. This is useful when, for example, the elements to be linked to do not bear identifiers. Further information about this and other forms of link addressing is provided in chapter 16 of the TEI Guidelines but is beyond the scope of the present document.

3.7.3 Special Kinds of Linking
The following special purpose \textit{linking} attributes are defined for every element in the TEI simplePrint schema:

\textbf{ana} links an element with its interpretation.

\textbf{corresp} links an element with one or more other corresponding elements.

\textbf{next} links an element to the next element in an aggregate.

\textbf{prev} links an element to the previous element in an aggregate.

The \textit{ana} (analysis) attribute is intended for use where a set of abstract analyses or interpretations have been defined somewhere within a document, as further discussed in section 10. \textit{Analysis}. For example, a linguistic analysis of the sentence John loves Nancy might be encoded as follows:

\begin{verbatim}
<seg type="sentence" ana="#SVO">
 <seg type="lex" ana="#NP1">John</seg>
 <seg type="lex" ana="#VVI">loves</seg>
 <seg type="lex" ana="#NP1">Nancy</seg>
</seg>
\end{verbatim}

This encoding implies the existence elsewhere in the document of elements with identifiers SVO, NP1, and VV1 where the significance of these particular codes is explained. Note the use of the \texttt{<seg>\ldots</seg>} element to mark particular components of the analysis, distinguished by the \textit{type} attribute.

The \textbf{corresp} (corresponding) attribute provides a simple way of representing some form of correspondence between two elements in a text. For example, in a multilingual text, it may be used to link translation equivalents, as in the following example:

\begin{verbatim}
<seg xml:lang="fr" xml:id="FR1" corresp="#EN1">Jean aime Nancy</seg>
<seg xml:lang="en" xml:id="EN1" corresp="#FR1">John loves Nancy</seg>
\end{verbatim}

The same mechanism may be used for a variety of purposes. In the following example, it has been used to represent the correspondences between the show and Shirley, and between NBC and the network:

\begin{verbatim}
<p>
 <title xml:id="shirley">Shirley</title>,
 which made its Friday night debut only a month ago, was not listed on
\end{verbatim}
The next and prev attributes provide a simple way of linking together the components of a discontinuous element, as in the following example:

`<q xml:id="Q1a" next="#Q1b">Who e debel you?</q> — he at last said — <q xml:id="Q1b" prev="#Q1a">you no speak e, damme, I kill e.</q> And so saying, the lighted tomahawk began flourishing about me in the dark.

4 Editorial Interventions

The process of encoding an electronic text has much in common with the process of editing a manuscript or other text for printed publication. In either case a conscientious editor may wish to record both the original state of the source and any editorial correction or other change made in it. The elements discussed in this and the next section provide some facilities for meeting these needs.

4.1 Correction and Normalization

The following elements may be used to mark corrections, that is editorial changes introduced where the editor believes the original to be erroneous:

- `<corr>` (correction) contains the correct form of a passage apparently erroneous in the copy text.
- `<sic>` (Latin for thus or so) contains text reproduced although apparently incorrect or inaccurate.

The following elements may be used to mark normalization, that is editorial changes introduced for the sake of consistency or modernization of a text:

- `<orig>` (original form) contains a reading which is marked as following the original, rather than being normalized or corrected.
- `<reg>` (regularization) contains a reading which has been regularized or normalized in some sense.

Consider, for example, the following famous passage as it appears in the first quarto printing of Shakespeare’s *Henry V*: in particular the phrase we might transcribe directly as

*at the turning o’th Tyde: for after I saw him stumble with the Sheers, and play with Flowers, and smile upon his fingers end, I knew there was but one way: for his Nose was as sharpe as a Pen, and a Table of greene fields. How now Sir Iohn (quoth I?) what man? be a good cheare: so a cruel oug God thee three or four times a new.*

Figure 1: Detail from *Henry V*, first quarto (1600)

... for his Nose was as sharpe as a Pen, and a Table of greene fields
A modern editor might wish to make a number of interventions here, specifically to modernize (or normalize) the Elizabethan spellings of a’ and sharpe for he and sharp respectively. They might also want to emend table to babbl’d, following an editorial tradition that goes back to the 18th century Shakespearian scholar Lewis Theobald. The following encoding would then be appropriate:

... for his Nose was as <reg>sharp</reg> as a Pen and <reg>he</reg> <corr resp="#Theobald">babbl’d</corr> of green fields

A more conservative or source-oriented editor, however, might want to retain the original, but at the same time signal that some of the readings it contains are in some sense anomalous:

... for his Nose was as <orig>sharpe</orig> as a Pen, and <orig>a</orig> <sic>Table</sic> of green fields

Finally, a modern digital editor may decide to combine both possibilities in a single composite text, using the <choice> element. <choice> (choice) groups a number of alternative encodings for the same point in a text. This allows an editor to indicate where alternative encodings are possible:

... for his Nose was as <choice> <orig>sharpe</orig> <reg>sharp</reg> as a Pen, and <orig>a</orig> <reg>he</reg> <choice> <corr resp="#Theobald">babbl’d</corr> <sic>Table</sic> of green fields

4.2 Omissions, Deletions, and Additions

In addition to correcting or normalizing words and phrases, editors and transcribers may also supply missing material, omit material, or transcribe material deleted or crossed out in the source. In addition, some material may be particularly hard to transcribe because it is hard to make out on the page. The following elements may be used to record such phenomena:

<add> (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector.
<gap> (gap) indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible.
<del> (deletion) contains a letter, word, or passage deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, or a previous annotator or corrector.
<unclear> (unclear) contains a word, phrase, or passage which cannot be transcribed with certainty because it is illegible or inaudible in the source.
4.2 Omissions, Deletions, and Additions

<supplied> (supplied) signifies text supplied by the transcriber or editor for any reason; for example because the original cannot be read due to physical damage, or because of an obvious omission by the author or scribe.

<subst> (substitution) groups one or more deletions (or surplus text) with one or more additions when the combination is to be regarded as a single intervention in the text.

These elements may be used to record changes made by an editor, by the transcriber, or (in manuscript material) by the author or scribe. For example, if the source for an electronic text read The following elements are provided for simple editorial interventions. then it might be felt desirable to correct the obvious error, but at the same time to record the deletion of the superfluous second for, thus:

The following elements are provided for <del resp="#LB">for</del> simple editorial interventions.

The attribute value #LB on the resp attribute is used to point to a fuller definition (typically in a <respStmt> element) of the person or other agency responsible for correcting the duplication of for.

If the source read The following elements provided for simple editorial interventions. (i.e. if the word are had been inadvertently dropped) then the scholar identified as LB might choose to encode the corrected text as follows:

The following elements <add resp="#LB">are</add> provided for simple editorial interventions.

These elements may also be used to record the actual writing process, for example to record passages which have been deleted, added, corrected etc., whether by the author of a literary text or by a scribe copying out a manuscript. An analysis of such documentary modifications may be essential before a reading text can be presented, and is clearly of importance in the editorial process.

The example is taken from the surviving authorial manuscript of a poem by the English writer Wilfred Owen, a part of which is shown here:

Figure 2: Detail from Dulce et decorum est autograph manuscript in the English Faculty Library, Oxford University.

Owen first wrote Helping the worst amongst us, but then deleted it, adding Dragging the worst amongst us over the top. In the same way, he revised the phrase half-blind by deleting the half- and adding all above it. In the last line, he started a word beginning fif before deleting it and writing the word five-nines. We can encode all of this as follows:
And towards our distant rest began to trudge,

Helping the worst amongst us

Dragging the worst amongst us

But limped on, blood–shod. All went lame;

half–all

blind;

Drunk with fatigue; deaf even to the hoots

Of tired, outstripped five–nines that dropped behind.

The tags `<add>` and `<del>` elements are used to enclose passages added or deleted respectively. Additional attributes are available such as `resp` to indicate responsibility for the modification, or `place` to indicate where in the text (for example, above or below the line) the modification has been made. Where the encoder wishes to assert that the addition and deletion make up a single editorial act of substitution, these elements can be combined within a `<subst>` element as shown above.

A very careful examination of Owen’s second modification shows that he really did write amongst rather than amongst, presumably in error. An equally careful editor wishing to restore the missing s might use the `<supplied>` element to indicate that they have done so:

Dragging the worst among<supplied resp="#ED">s</supplied> t us</add>

Here the `resp` attribute has been used to indicate that the s was not supplied by Owen but by someone else, specifically the person documented elsewhere by an element with the identifier ED.

The `<unclear>` element is useful where material in the source is so hard to read that the transcriber is uncertain as to whether they have done so correctly. The `<gap>` element by contrast should be used where the material is so illegible that the transcriber does not wish even to attempt it. The two may however be used together as in the following example:

One hundred & twenty good regulars joined <unclear>to me <gap extent="2 words" reason="indecipherable"/> and </unclear> instantly, would aid me signally in an enterprise against Wilmington.

The `<del>` element marks material which is deleted in a source, but has been transcribed as part of the electronic text all the same, while `<gap>` marks the location of source material which is omitted from the electronic text, whether it is legible or not. A language corpus, for example, might omit long quotations in foreign languages. An `extent` attribute is available on the `<gap>` element to indicate how much material has been omitted. The `<desc>` element can be used inside the `<gap>` element to provide a brief characterisation of the omitted material, as in the following examples:

... An example of a list appearing in a fief ledger of <name type="place">Koldinghus</name> is given below. It shows cash income from a sale of honey. </p>
<gap extent="50 lines"> 
<desc>quotation from ledger (in Danish)</desc> 
</gap>
A description of the overall structure of the account is once again ...

(The `<name>` and `<date>` elements used in this example are discussed further below)

Language corpora (particularly those constructed before the widespread use of scanners) often systematically omit figures and mathematics:

At the bottom of your screen below the mode line is the `<hi>minibuffer</hi>`. This is the area where Emacs echoes the commands you enter and where you specify filenames for Emacs to find, values for search and replace, and so on. `<gap reason="graphic">
<desc>diagram of Emacs screen</desc>
</gap>

4.3 Abbreviation and their Expansion

Like names, dates, and numbers, abbreviations may be transcribed as they stand or expanded; they may be left unmarked, or encoded using the following elements:

- `<abbr>` (abbreviation) contains an abbreviation of any sort.
- `<expan>` (expansion) contains the expansion of an abbreviation.

The `<abbr>` element is useful as a means of distinguishing semi-lexical items such as acronyms or jargon:

Every manufacturer of `<abbr>3GL</abbr>` or `<abbr>4GL</abbr>` languages is currently nailing on `<abbr>OO</abbr>` extensions

The `type` attribute may be used to distinguish types of abbreviation by their function.

The `<expan>` element is used to mark an expansion supplied by an encoder. This element is particularly useful in the transcription of manuscript materials. For example, the character p with a bar through its descender as a conventional representation for the word per is commonly encountered in Medieval European manuscripts. An encoder may choose to expand this as follows:

`per`<expan>

To record both an abbreviation and its expansion, the `<choice>` element mentioned above may be used to group the abbreviated form with its proposed expansion:

```
<choice>
  <abbr>wt</abbr>
  <expan>with</expan>
</choice>
```

The elements `<expan>` and `<abbr>` should contain a full word, or the abbreviated form of a full word respectively. For a fuller discussion of abbreviations and the intricacies of representing them consult the section on [Abbreviation and Expansion] in the TEI Guidelines.
5 Names, Codes, and Numbers

The TEI scheme defines elements for a large number of data-like features which may appear almost anywhere within almost any kind of text. These features may be of particular interest in a range of disciplines; they all relate to objects external to the text itself, such as the names of persons and places, strings of code, formulae, or numbers and dates. These items may also pose particular problems for natural language processing (NLP) applications. The elements described here, by making such features explicit, reduce the complexity of processing texts containing them.

5.1 Names and Referring Strings

A referring string is any phrase which refers to some person, place, object, etc. A name is a referring string which contains proper nouns and honorifics only. Two elements are provided to mark such strings:

- `<rs>` (referencing string) contains a general purpose name or referring string.
- `<name>` (name, proper noun) contains a proper noun or noun phrase.

The type attribute is used to distinguish amongst (for example) names of persons, places and organizations, where this is possible:

```xml
<q>My dear <name type="person">Mr. Bennet</name>, said his lady to him one day,
have you heard that <name type="place">Netherfield Park</name> is let at last?</q>
```

It being one of the principles of the <name type="org">Circumlocution Office</name> never, on any account whatsoever, to give a straightforward answer, <name type="person">Mr Barnacle</name> said,

```xml
<q>Possibly.</q>
```

As the following example shows, the `<rs>` element may be used for a reference to a person, place, etc., which does not contain a proper noun or noun phrase:

```xml
<q>My dear <name type="person">Mr. Bennet</name>, </q> said <rs type="person">his lady</rs> to him one day...
```

Simply tagging something as a name is rarely enough to enable automatic processing of personal names into the canonical forms usually required for reference purposes. The name as it appears in the text may be inconsistently spelled, partial, or vague. Moreover, name prefixes such as van or de la, may or may not be included as part of the reference form of a name, depending on the language and country of origin of the bearer.

The ref attribute provides a way of linking a name with a description of the object being named, and may thus act as a normalized identifier for it. It is also very useful as a means of gathering together all references to the same individual or location scattered throughout a document:

```xml
<q>My dear <name type="person" ref="#BENM1">Mr. Bennet</name>, </q> said <rs type="person" ref="#BENM2">his lady</rs> to him one day,
have you heard that <name type="place" ref="#NETP1">Netherfield Park</name> is let at last?</q>
```
The values used for the `ref` attribute here (#BENM1 etc.) are pointers; in this case indicating an element with the identifier BENM1 etc. somewhere in the current document, though any form of URI could be used. The element indicated will typically (for a person) be a `<person>` element, listed within a `<particDesc>` element, or (for a place) a `<place>` element, listed within a `<settingDesc>` element in the TEI header, as further discussed in 15.3. The Profile Description below.

This use should be distinguished from the case of the `<reg>` (regularization) element, which provides a means of marking the standard form of a referencing string as demonstrated below:

```xml
<name type="person" ref="#WADLM1">
  <choice>
    <orig>Walter de la Mare</orig>
    <reg>de la Mare, Walter</reg>
  </choice>
</name> was born at <name ref="https://en.wikipedia.org/wiki/Charlton,_London" type="place">Charlton</name>, in <name type="place">Kent</name>, in 1873.
```

5.2 Formulae, Codes, and Special Characters

The following elements may be useful when marking up sequences of text that represent mathematical expressions, chemical formulae, and the like:

- `<formula>` (formula) contains a mathematical or other formula.
- `<g>` (character or glyph) represents a glyph, or a non-standard character.

In many cases, a simple Unicode character suffices to represent the superscript or subscript digits and other symbols which may appear inside a mathematical formula:

```xml
<formula>E=mc²</formula>
```

In other more complex cases, the encoder may choose to use a different XML scheme (such as MathML) to encode the content of a formula, or a non-XML notation. These possibilities are not discussed further here.

The `<g>` element is useful in the case that no Unicode character exists to represent the character or glyph required. Its `ref` attribute can be used to point to a definition of the symbol intended, while its content (if any) represents a Unicode approximation to it:

```xml
...Thereto
<g ref="#air">[air]</g> and ...
```

The TEI header provides a number of additional elements for the definition of such non-Unicode characters, as further discussed in section 15.2.5. The character declaration below.

The following elements are useful for stretches of code or similar formal language appearing within a text:

- `<code>` contains literal code from some formal language such as a programming language.
- `<email>` (electronic mail address) contains an email address identifying a location to which email messages can be delivered.

```xml
This can be expressed in XML as follows:
<code>&lt;date notBefore="2016-06-23"/&gt;</code> Contact the author at <email>lou.burnard@gmail.com</email>
```
5 NAMES, CODES, AND NUMBERS

Note in this example that characters which have a syntactic function in XML (such as the ampersand or the angle bracket) must be represented within a TEI simplePrint document by means of an entity reference such as &lt; or &amp;.

The element <ref> discussed in section 3.7. Cross References and Links should be used to represent a coded reference such as a link given as a URL within a text, either as content or as an attribute value:

```xml
<p>Further discussion of <ref target="http://www.tei-c.org/">the Text Encoding Initiative website</ref> may be found at <ref>http://www.tei-c.org/</ref></p>
```

5.3 Dates and Times

The following elements are provided for the detailed encoding of times and dates:

- `<date>` (date) contains a date in any format.
- `<time>` (time) contains a phrase defining a time of day in any format.

These elements have a number of attributes which can be used to provide normalized versions of their values in various ways.

- `att.datable` provides attributes for normalization of elements that contain dates, times, or datable events.
- `@period` supplies pointers to one or more definitions of named periods of time (typically `<category>`s, `<date>`s or `<event>`s) within which the datable item is understood to have occurred.
- `@when [att.datable.w3c]` supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.
- `@notBefore [att.datable.w3c]` specifies the earliest possible date for the event in standard form, e.g. yyyy-mm-dd.
- `@notAfter [att.datable.w3c]` specifies the latest possible date for the event in standard form, e.g. yyyy-mm-dd.

The `when` attribute specifies a normalized form for the date or time, using one of the standard formats defined by ISO 8601. Partial dates or times (e.g. 1990, September 1990, twelvish) can be expressed by omitting a part of the value supplied, as in the following examples:

```xml
<date when="1980-02-21">21 Feb 1980</date>
<date when="1990">1990</date>
<date when="1990-09">September 1990</date>
<date when="2001-09-11T12:48:00">Sept 11th, 12 minutes before 9 am</date>
```

These attributes are typically used to make a date or time more easily processable, as in the following examples:

Given on the
<date when="1977-06-12">Twelfth Day of June in the Year of Our Lord One Thousand Nine Hundred and Seventy-seven of the Republic the Two Hundredth and first and of the University the Eighty-Sixth.</date>
specially when it’s nine below zero
and three o’clock in the afternoon

They are also useful in cases where the date concerned is uncertain or only vaguely specified:

... during the second empire

in the weeks shortly before my birth

5.4 Numbers and Measurements

Like dates, both numbers and quantities can be written with either letters or digits and may therefore need to be normalized for ease of processing. Their presentation is also highly language-dependent (e.g. English 5th becomes Greek 5.; English 123,456.78 equals French 123.456,78).

The following elements are provided for the detailed encoding of numbers and quantities:

- `<num>` (number) contains a number, written in any form.
  - `@type` indicates the type of numeric value.
  - `@value` supplies the value of the number in standard form.

- `<measure>` (measure) contains a word or phrase referring to some quantity of an object or commodity, usually comprising a number, a unit, and a commodity name.
  - `@quantity` specifies the number of the specified units that comprise the measurement
  - `@unit` indicates the units used for the measurement, usually using the standard symbol for the desired units.
  - `@commodity` indicates the substance that is being measured

For example:

```xml
<num value="33">xxxiii</num>
<num type="cardinal" value="21">twenty-one</num>
<num type="percentage" value="10">ten percent</num>
<num type="percentage" value="10">10%</num>
<num type="ordinal" value="5">5th</num>

<measure quantity="40" unit="hogshead" commodity="rum">2 score hh rum</measure>
<measure quantity="1" unit="dozen" commodity="blooms">1 doz. roses</measure>
<measure quantity="1" unit="count" commodity="blooms">a yellow tulip</measure>
```
Lists

The element `<list>` is used to mark any kind of list. A list is a sequence of text items, which may be numbered, bulleted, or arranged as a glossary list. Each item may be preceded by an item label (in a glossary list, this label is the term being defined):

- `<list>` (list) contains any sequence of items organized as a list.
- `<item>` (item) contains one component of a list.
- `<label>` (label) contains any label or heading used to identify part of a text, typically but not exclusively in a list or glossary.

Individual list items are tagged with `<item>`. The first `<item>` may optionally be preceded by a `<head>`, which gives a heading for the list. The numbering of items within the list may be omitted, indicated using the `n` attribute on each item, or (rarely) tagged as content using the `<label>` element. The following are all thus equivalent:

```xml
<list>
  <head>A short list</head>
  <item>First item in list.</item>
  <item>Second item in list.</item>
  <item>Third item in list.</item>
</list>

<list>
  <head>A short list</head>
  <item n="1">First item in list.</item>
  <item n="2">Second item in list.</item>
  <item n="3">Third item in list.</item>
</list>

<list>
  <head>A short list</head>
  <label>1</label>
  <item>First item in list.</item>
  <label>2</label>
  <item>Second item in list.</item>
  <label>3</label>
  <item>Third item in list.</item>
</list>
```

The styles should not be mixed in the same list.

A simple two-column table may be treated as a glossary list, tagged `<list type="gloss">`. Here, each item comprises a `term` and a `gloss`, marked with `<label>` and `<item>` respectively.

```xml
<list type="gloss">
  <head>Vocabulary</head>
  <label xml:lang="enm">nu</label>
  <item>now</item>
  <label xml:lang="enm">lhude</label>
  <item>loudly</item>
  <label xml:lang="enm">bloweth</label>
  <item>blooms</item>
  <label xml:lang="enm">med</label>
  <item>meadow</item>
  <label xml:lang="enm">wude</label>
  <item>wood</item>
  <label xml:lang="enm">awe</label>
  <item>ewe</item>
  <label xml:lang="enm">lhouth</label>
  <item>lows</item>
  <label xml:lang="enm">sterteth</label>
  <item>bounds, frisks</item>
</list>
```
Where the internal structure of a list item is more complex, it may be preferable to regard the list as a *table*, for which special-purpose tagging is defined in section 8. *Tables*.

Lists of whatever kind can, of course, nest within list items to any depth required. Here, for example, a glossary list contains two items, each of which is itself a simple list:

```
<list type="gloss">
  <label>EVIL</label>
  <item type="simple">
    <item>I am cast upon a horrible desolate island, void of all hope of recovery.</item>
    <item>I am singled out and separated as it were from all the world to be miserable.</item>
    <item>I am divided from mankind – a solitaire; one banished from human society.</item>
  </item>
  <item type="simple">
    <item>But I am alive; and not drowned, as all my ship’s company were.</item>
    <item>But I am singled out, too, from all the ship’s crew, to be spared from death...</item>
    <item>But I am not starved, and perishing on a barren place, affording no sustenances....</item>
  </item>
</list>
```

Lists of bibliographic items should be tagged using the `<listBibl>` element, described in the next section.

### 7 Bibliographic Citations

It is often useful to distinguish bibliographic citations where they occur within texts being transcribed for research, if only so that they will be properly formatted when the text is printed out. The element `<bibl>` is provided for this purpose. Where the components of a bibliographic reference are to be distinguished, the following elements may be used as appropriate. It is generally useful to distinguish at least those parts (such as the titles of articles, books, and journals) which will need special formatting. The other elements are provided for cases where particular interest attaches to such details:

- `<bibl>` (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.
- `<author>` (author) in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority.
<biblScope> (scope of bibliographic reference) defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<date> (date) contains a date in any format.

<editor> contains a secondary statement of responsibility for a bibliographic item, for example the name of an individual, institution or organization, (or of several such) acting as editor, compiler, translator, etc.

<publisher> (publisher) provides the name of the organization responsible for the publication or distribution of a bibliographic item.

<pubPlace> (publication place) contains the name of the place where a bibliographic item was published.

<relatedItem> contains or references some other bibliographic item which is related to the present one in some specified manner, for example as a constituent or alternative version of it.

<title> (title) contains a title for any kind of work.

Consider, for example the following editorial note:

He was a member of Parliament for Warwickshire in 1445, and died March 14, 1470 (according to Kittredge, Harvard Studies 5. 88ff).

This might be encoded as follows:

```
He was a member of Parliament for Warwickshire in 1445, and died March 14, 1470 (according to <bibl>
<author>Kittredge</author>,
<title>Harvard Studies</title> 5. 88ff
</bibl>).
```

The bibliographic elements listed above are particularly useful in a born digital document which contains a bibliography encoded using the <listBibl> element. Entries in the bibliography should be given an identifier, which can then be used as the target of cross references from elsewhere in the document:

```
<p>Perec citing, amongst others <ref target="#MK_73">Sturm und Drang, 1973</ref>, concludes ... </p>
```

A <bibl> element may contain simply text, with possibly a few of its components distinguished by tagging, and much use of conventionalized punctuation, as in this example:

```
```

Alternatively, each of the components of the bibliographic reference may be clearly distinguished by tagging; in this case there is no requirement for conventionalized punctuation, since the processor will be able to generate this appropriately:

```
<bibl xml:id="MK73">
<author>Sturm, U.</author>
<author>Drang, F.</author>
<title xml:lang="de" level="m">Musikalische Katastrophe</title>
<pubPlace>Berlin</pubPlace>
```

32
The element `<biblFull>` is also provided for convenience in cases where bibliographic citations following a more sophisticated model have been used; it is permitted only in the TEI header. `<biblFull>` (fully-structured bibliographic citation) contains a fully-structured bibliographic citation, in which all components of the TEI file description are present. `<listBibl>` (citation list) contains a list of bibliographic citations of any kind.

The `<listBibl>` element is used to group lists of bibliographic citations. It may contain a series of `<bibl>` or `<biblFull>` elements.

8 Tables

The following elements are provided for the description of tabular matter, commonly found in many kinds of narrative text. Note that TEI simplePrint provides no sophisticated ways of describing the detailed layout of a table beyond its organization into rows and columns.

`<table>` (table) contains text displayed in tabular form, in rows and columns.

`<row>` (row) contains one row of a table.

`<cell>` (cell) contains one cell of a table.

The `role` attribute may be used on either `<cell>` or `<row>` to indicate the function of a cell, or of a row of cells. Its values should be taken from the following list:

-data data cell
-label label cell
-sum row or column sum data
-total table total data

For example, Defoe uses mortality tables like the following in the *Journal of the Plague Year* to show the rise and ebb of the epidemic:

```xml
<p>It was indeed coming on amain, for the burials that same week were in the next adjoining parishes thus:-
<table rows="5" cols="4">
  <row role="data">
    <cell role="label">St. Leonard's, Shoreditch</cell>
    <cell role="data">64</cell>
    <cell role="data">84</cell>
    <cell role="data">119</cell>
  </row>
  <row role="data">
    <cell role="label">St. Botolph's, Bishopsgate</cell>
    <cell role="data">65</cell>
    <cell role="data">105</cell>
    <cell role="data">116</cell>
  </row>
  <row role="data">
    <cell role="label">St. Giles's, Cripplegate</cell>
    <cell role="data">213</cell>
    <cell role="data">421</cell>
    <cell role="data">554</cell>
  </row>
</table>
```
This shutting up of houses was at first counted a very cruel and unchristian method, and the poor people so confined made bitter lamentations. ...
Figure 3: *Mr Fezziwig’s Ball*: illustration by George Cruikshank from Dickens’ *A Christmas Carol* (1843)
These cases should be carefully distinguished from the case where an encoded text is complemented by a collection of digital images, maintained as a distinct resource. The facs attribute may be used to associate any element in an encoded text with a digital facsimile of it. In the simplest case, the facs attribute on the <pb> element may be used to supply a location for an image file corresponding with that point in the text:

This method is only appropriate in the simple case where each digital image file page1.png etc. corresponds with a single transcribed and encoded page. If multiple images are provided for each page, or more detailed alignment of image and transcription is required, for example because the image files actually represent double page spreads, more sophisticated mechanisms are needed, as further discussed in 14. Encoding a Digital Facsimile below.

10 Analysis

10.1 Orthographic Sentences

Interpretation typically ranges across the whole of a text, with no particular respect to other structural units. A useful preliminary to intensive interpretation is therefore to segment the text into discrete and identifiable units, each of which can then bear a label for use as a sort of canonical reference. To facilitate such uses, these units may not cross each other, nor nest within each other. They may conveniently be represented using the following element:

<s> (s-unit) contains a sentence-like division of a text.

As the name suggests, the <s> element is most commonly used (in linguistic applications at least) for marking orthographic sentences, that is, units defined by orthographic features such as punctuation. For example, the passage from Jane Eyre discussed earlier might be divided into s-units as follows:

Reader, I married him.
A quiet wedding we had:
he and I, the parson and clerk, were alone present.
When we got back from church, I went into the kitchen of the manor-house, where Mary was cooking the dinner, and John cleaning the knives, and I said —
Mary, I have been married to Mr Rochester this morning.
10.2 Words and Punctuation

Tokenization, that is, the identification of lexical or non-lexical tokens within a text, is a very common requirement for all kinds of textual analysis, and not an entirely trivial one. The decision as to whether, for example, can't in English or du in French should be treated as one word or two is not simple. Consequently it is often useful to make explicit the preferred tokenization in a marked up text. The following elements are available for this purpose:

- `<w>` (word) represents a grammatical (not necessarily orthographic) word.
- `<c>` (character) represents a character.
- `<pc>` (punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark.

For example, the output from a part of speech tagger might be recorded in TEI simplePrint as follows:

```xml
<s n="1">
  <w ana="#NP0">Marley</w>
  <w ana="#VBD">was</w>
  <w ana="#AJ0">dead</w>
  <pc>;</pc>
  <w ana="#TO0">to</w>
  <w ana="#VBB">begin</w>
  <w ana="#PRP">with</w>
  <pc ana="#SENT">.</pc>
</s>
```

In this example, each token in the input has been decorated with an automatically generated part of speech code, using the `ana` attribute discussed in section 3.7.3. Special Kinds of Linking above. The system has also distinguished between tokens to be treated as words (tagged `<w>`) and tokens considered to be punctuation (tagged `<pc>`). It may also sometimes be useful to distinguish tokens which consist of a single letter or character: the `<c>` element is provided for this purpose.

The `<w>` also provides for each word to be associated with a root form or lemma, either explicitly using the `lemma` attribute, or by reference, using the `lemmaRef` attribute, as in this example:

```xml
...<w ana="#VBD" lemma="be" lemmaRef="http://www.myLexicon.com/be">was</w> ...
```

10.3 General-Purpose Interpretation Elements

The `<w>` element is a specialisation of the `<seg>` element which has already been introduced for use in identifying otherwise unmarked targets of cross references and hypertext links (see...
section 3.7. Cross References and Links); it can be used to distinguish any portion of text to which the encoder wishes to assign a user-specified type or a unique identifier; it may thus be used to tag textual features for which there is no other provision in the published TEI Guidelines.

For example, the TEI Guidelines provide no apostrophe element to mark parts of a literary text in which the narrator addresses the reader (or hearer) directly. One approach might be to regard these as instances of the \texttt{<q> element, distinguished from others by an appropriate value for the who attribute. A possibly simpler, and certainly more general, solution would however be to use the \texttt{<seg> element as follows:

\begin{verbatim}
<div type="chapter" n="38">
  <p>
    <seg type="apostrophe">Reader, I married him.\texttt{</seg> A quiet wedding we had:
    ...
  </p>
</div>
\end{verbatim}

The \texttt{type} attribute on the \texttt{<seg> element can take any value, and so can be used to distinguish phrase-level phenomena of any kind; it is good practice to record the values used and their significance in the TEI header or in the documentation of the encoding system.

11 Common Attributes

Some attributes are available on many elements, though not on all. These attributes are defined using a TEI attribute class, a concept which is discussed further in the TEI Guidelines. We list here some attribute classes which have been adapted or customized for use in TEI simplePrint.

The elements \texttt{<add>}, \texttt{<figure>}, \texttt{<fw>}, \texttt{<label>}, \texttt{<note>} and \texttt{<stage>} all take the attribute \texttt{place} to indicate whereabouts on the page they appear. In TEI simplePrint the possible values for this attribute are limited as indicated below:

\texttt{att.placement} provides attributes for describing where on the source page or object a textual element appears.

\begin{itemize}
  \item \texttt{@place} specifies where this item is placed.
  \item \texttt{above} above the line
  \item \texttt{below} below the line
  \item \texttt{top} at the top of the page
  \item \texttt{top-right} at the top right of the page
  \item \texttt{top-left} at the top left of the page
  \item \texttt{top-centre} at the top center of the page
  \item \texttt{bottom-right} at the bottom right of the page
  \item \texttt{bottom-left} at the bottom left of the page
  \item \texttt{bottom-centre} at the bottom centre of the page
  \item \texttt{bottom} at the foot of the page
  \item \texttt{tablebottom} underneath a table
  \item \texttt{margin-right} in the right-hand margin
  \item \texttt{margin} in the outer margin
\end{itemize}
**margin-inner** in the inner margin

**margin-left** in the left-hand margin

**opposite** on the opposite, i.e. facing, page

**overleaf** on the other side of the leaf

**overstrike** superimposed on top of the current context

**end** at the end of the volume

**divend** at the end of the current division

**parend** at the end of the current paragraph

**inline** within the body of the text

**inspace** in a predefined space, for example left by an earlier scribe

**block** formatted as an indented paragraph

The elements `<add>`, `<am>`, `<corr>`, `<date>`, `<del>`, `<ex>`, `<expan>`, `<gap>`, `<name>`, `<reg>`, `<space>`, `<subst>`, `<supplied>`, `<time>` and `<unclear>` all use the attribute `unit` to indicate the units in which the size of the feature concerned is expressed. In TEI simplePrint the possible values for this attribute are limited as indicated below:

- `<name>` (name, proper noun) contains a proper noun or noun phrase.

  @`type` characterizes the element in some sense, using any convenient classification scheme or typology.

**chars** characters

**lines** lines

**pages** pages

**words** words

**cm** centimetres

**mm** millimetres

**in** inches

Very many TEI elements take the value `type` (see the specification for `att.typed` for a full list). In most cases, no constraint is placed on the possible values for this attribute. In the case of the element `<name>` however, the possible values for this attribute are limited as indicated below:

- `<name>` (name, proper noun) contains a proper noun or noun phrase.

  @`type` characterizes the element in some sense, using any convenient classification scheme or typology.

**person** person

**forename** forename

**surname** surname

**personGenName** generational name component
12 Composite and Floating Texts

A composite text, like a simple text, has an optional front and back matter. In between however, instead of a single body, it contains one or more discrete texts, each with its own optional front and back matter. The following elements are provided to handle composite texts of various kinds.

[group] (group) contains the body of a composite text, grouping together a sequence of distinct texts (or groups of such texts) which are regarded as a unit for some purpose, for example the collected works of an author, a sequence of prose essays, etc.

-floatingText> (floating text) contains a single text of any kind, whether unitary or composite, which interrupts the text containing it at any point and after which the surrounding text resumes.

-teiCorpus> (TEI corpus) contains the whole of a TEI encoded corpus, comprising a single corpus header and one or more TEI elements, each containing a single text header and a text.

A typical example might be an anthology containing several distinct works, or any other kind of collection, encoded using an overall structure like this:

```xml
<TEI xmlns="http://www.tei-c.org/ns/1.0">
<teiHeader>
<!--[ header information for the composite ]-->  
</teiHeader>
</text>
<!--[ front matter for the composite ]--> 
</front>
<group>
<text>
<!--[ front matter of first text ]--> 
</front>
<body>
<!--[ body of first text ]--> 
</body>
<!--[ back matter of first text ]--> 
</back>
</text>
<text>
<!--[ front matter of second text ]--> 
</front>
<body>
<!--[ body of second text ]--> 
</body>
</text>
</TEI>
```
A different kind of composite text occurs when one text is embedded within another, as for example in the Arabian Nights or similar collections of stories, or in other cases where one narrative is interrupted by another. The element <floatingText> may be preferred to encode such materials as the following:

<p>The Gentleman having finish'd his Story, Galecia waited on him to the Stairs-head; and at her return, casting her Eyes on the Table, she saw lying there an old dirty rumpled Book, and found in it the following story:</p>

<p>IN the time of the Holy War when Christians from all parts went into the Holy Land to oppose the Turks; Amongst these there was a certain English Knight... </p>

<p>The King graciously pardoned the Knight; Richard was kindly receiv'd into his Convent, and all things went on in good order: But from hence came the Proverb, We must not strike <hi>Robert</hi> for <hi>Richard</hi>.</p>

<p>By this time Galecia's Maid brought up her Supper; after which she cast her Eyes again on the foresaid little Book, where she found the following Story ....</p>

Note that there is only a single TEI header for composite texts of either kind, since the assumption is that the composite is at some level describable as a single work. However, it is also possible to define a composite of complete TEI texts, each with its own TEI header. Such a collection is known as a TEI corpus, and must itself have a TEI header:
It is also possible to create a composite of corpora – that is, one element may contain many nested elements rather than many nested elements, to any depth considered necessary.

13 Front and Back Matter

13.1 Front Matter

For many purposes, particularly in older texts, the preliminary material such as title pages, prefatory epistles, etc., may provide very useful additional linguistic or social information. The TEI Guidelines provide a set of recommendations for distinguishing the textual elements most commonly encountered in front matter, which are summarized here.

13.1.1 Title Page

The start of a title page should be marked with the element \texttt{<titlePage>}. All text contained on the page should be transcribed and tagged with the appropriate element from the following list:

- \texttt{<titlePage>} (title page) contains the title page of a text, appearing within the front or back matter.
- \texttt{<docTitle>} (document title) contains the title of a document, including all its constituents, as given on a title page.
- \texttt{<titlePart>} (title part) contains a subsection or division of the title of a work, as indicated on a title page.
- \texttt{<byline>} (byline) contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.
- \texttt{<docAuthor>} (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline).
- \texttt{<docDate>} (document date) contains the date of a document, as given on a title page or in a dateline.
- \texttt{<docImprint>} (document imprint) contains the imprint statement (place and date of publication, publisher name), as given (usually) at the foot of a title page.
- \texttt{<epigraph>} (epigraph) contains a quotation, anonymous or attributed, appearing at the start or end of a section or on a title page.

Typeface distinctions should be marked with the \texttt{rendition} attribute when necessary, as described above though a very detailed description of the letter spacing and sizing used in ornamental titles is not easily done. Changes of language should be marked by appropriate use of the \texttt{xml:lang} attribute or the \texttt{<foreign>} element, as necessary. Names of people, places, or organizations, may be tagged using the \texttt{<name>} element wherever they appear if no other more specific element is available.

Two example title pages follow:
13.1 Front Matter

As elsewhere, the ref attribute may be used to link a name with a canonical definition of the entity being named. For example:

By <docAuthor>
   <name ref="http://en.wikipedia.org/wiki/Agnes_Strickland">Agnes Strickland</name>
</docAuthor>
</byline>

13.1.2 Prefatory Matter

Major blocks of text within the front matter should be marked using <div> elements; the following suggested values for the type attribute may be used to distinguish various common types of prefatory matter:

**preface** A foreword or preface addressed to the reader in which the author or publisher explains the content, purpose, or origin of the text.

**dedication** A formal offering or dedication of a text to one or more persons or institutions by the author.

**abstract** A summary of the content of a text as continuous prose.
ack A formal declaration of acknowledgment by the author in which persons and institutions are thanked for their part in the creation of a text.

contents A table of contents, specifying the structure of a work and listing its constituents.

The <list> element should be used to mark its structure.

frontispiece A pictorial frontispiece, possibly including some text.

Where other kinds of prefatory matter are encountered, the encoder is at liberty to invent other values for the type attribute.

13.1.3 Liminal Elements

All text divisions, whether in front matter or elsewhere, may begin and end with one or more components which we term *liminal elements*, because they begin or end the division. A typical example is a heading or title of some kind which should be tagged using the <head> element; but there are many other possibilities:

<salute> (salutation) contains a salutation or greeting prefixed to a foreword, dedicatory epistle, or other division of a text, or the salutation in the closing of a letter, preface, etc.

<signed> (signature) contains the closing salutation, etc., appended to a foreword, dedicatory epistle, or other division of a text.

<byline> (byline) contains the primary statement of responsibility given for a work on its title page or at the head or end of the work.

<dateline> (dateline) contains a brief description of the place, date, time, etc. of production of a letter, newspaper story, or other work, prefixed or suffixed to it as a kind of heading or trailer.

<argument> (argument) contains a formal list or prose description of the topics addressed by a subdivision of a text.

<cit> (cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example.

<imprimatur> (imprimatur) contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<opener> (opener) groups together dateline, byline, salutation, and similar phrases appearing as a preliminary group at the start of a division, especially of a letter.

<closer> (closer) groups together salutations, datelines, and similar phrases appearing as a final group at the end of a division, especially of a letter.

<postscript> contains a postscript, e.g. to a letter.

As an example, the beginning and end of the dedication to Milton’s *Comus* might be marked up as follows:

```
<div type="dedication">
 <head>To the Right Honourable <name>JOHN Lord Viscount BRACLY</name>, Son and Heir apparent to the Earl of Bridgewater, &c.</head>
<p>This <hi>Poem</hi>, which receiv'd its first occasion of Birth from your Self, and others of your Noble Family .... and as in this representation your attendant <name>Thyrsis</name>, so now in all reall expression</p>
 <closer>
 <salute>Your faithfull, and most humble servant</salute>
 <signed>
  <name>H. LAWES.</name>
```
13.2 Back Matter

13.2.1 Structural Divisions of Back Matter

Because of variations in publishing practice, back matter can contain virtually any of the elements listed above for front matter, and the same elements should be used where this is so. Additionally, back matter may contain the following types of matter within the `<back>` element. Like the structural divisions of the body, these should be marked as `<div>` elements, and distinguished by the following suggested values of the `type` attribute:

appendix An ancillary self-contained section of a work, often providing additional but in some sense extra-canonical text.

Glossary A list of terms associated with definition texts (glosses): this should be encoded as a `<list type="gloss">` element.

Notes A section in which textual or other kinds of notes are gathered together.

Bibliogr A list of bibliographic citations: this should be encoded as a `<listBibl>`.

Index Any form of pre-existing index to the work

Colophon A statement appearing at the end of a book describing the conditions of its physical production.

13.2.2 Specialized Front and Back Matter

TEI simplePrint also provides elements for some additional components of front or back matter which are characteristic of particular kinds of text, in particular old play texts. These often include lists of dramatis personae and notes about the setting of a play, for which the following elements are provided:

- `<castList>` (cast list) contains a single cast list or dramatis personae.
- `<castItem>` (cast list item) contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.
- `<castGroup>` (cast list grouping) groups one or more individual `<castItem>` elements within a cast list.
- `<role>` (role) contains the name of a dramatic role, as given in a cast list.
- `<roleDesc>` (role description) describes a character’s role in a drama.
- `<actor>` contains the name of an actor appearing within a cast list.
- `<set>` (setting) contains a description of the setting, time, locale, appearance, etc., of the action of a play, typically found in the front matter of a printed performance text (not a stage direction).

Note that these elements are intended for use in marking up cast lists and setting notes as they appear in a source document. They are not intended for use when marking up definitive lists of the different roles identified in a play, except in so far as that may have been their original purpose.

The following example shows one way of encoding the last part of Shakespeare’s Tempest, as printed in the first folio:
\[\text{Epilogue, spoken by Prospero.}\]

Now my Charmes are all ore-throwne,
And what strength I have’s mine owne,
As you from crimes would pardon’d be,
Let your Indulgence set me free.

Exit

The Scene, an un-inhabited Island.

Names of the Actors.

Alonso, K. of Naples
Sebastian, his Brother.
Prospero, the right Duke of Millaine.

14 Encoding a Digital Facsimile

The following elements may be used to encode a text represented by a collection of digital images, either alone or in conjunction with a textual transcription.

\(<\text{facsimile}>\) contains a representation of some written source in the form of a set of images rather than as transcribed or encoded text.

\(<\text{surface}>\) defines a written surface as a two-dimensional coordinate space, optionally grouping one or more graphic representations of that space, zones of interest within that space, and, when using an embedded transcription approach, transcriptions of the writing within them.

\(<\text{zone}>\) defines any two-dimensional area within a \(<\text{surface}>\) element.

As mentioned in section 9. Figures and Graphics above, a TEI simplePrint document may reference a set of page images, alone, or in combination with a transcription. For ease of management, it is strongly recommended that the \(<\text{graphic}>\) elements representing those page images be grouped together within a \(<\text{facsimile}>\) element, as in the following example:

\(<\text{facsimile}>\)
\(<\text{graphic} url="page1.png" xml:id="pg1"/>\)
\(<\text{graphic} url="page2.png" xml:id="pg2"/>\)
\(</\text{facsimile}>\)

If a transcription is supplied in addition, the xml:id values can be used to align the page breaks within it with the relevant image, rather than using the URL given on the \(<\text{graphic}>\) element.

\(<\text{text}>\)
\(<\text{pb facs="#page1"/>\)
\(<\text{pb facs="#page2"/>\)
\(</\text{text}>\)
The `<surface>` element is useful in two situations: when it is desired to group different images of the same page, for example of different resolutions; and when it is desired to align parts of a page image with parts of a transcription. The `<zone>` element is used to define (and hence provide an identifier for) the location of a part of an image with reference to the surface on which it appears.

In this example, a thumbnail and a high resolution image are associated with the same surface:

```xml
<facsimile>
  <surface>
    <graphic xml:id="page1T" url="thumbs/page1.png"/>
    <graphic xml:id="page1" url="page1.png"/>
  </surface>
</facsimile>
```

In this example, the `<head>` element in the transcription is aligned with the top half of a square image:

```xml
<facsimile>
  <surface ulx="1" uly="1" lrx="4" lry="4">
    <graphic url="page1.png" xml:id="page1"/>
    <zone xml:id="topHalfP1" ulx="1" uly="1" lrx="2" lry="4"/>
  </surface>
</facsimile>
```

A more detailed explanation of the use of these attributes and other associated elements is given in the full TEI Guidelines.

15 The Electronic Title Page

Every TEI text has a header which provides information analogous to that provided by the title page of printed text. The header is introduced by the element `<teiHeader>` and has four major parts:

- `<fileDesc>` (file description) contains a full bibliographic description of an electronic file.
- `<encodingDesc>` (encoding description) documents the relationship between an electronic text and the source or sources from which it was derived.
- `<profileDesc>` (text-profile description) provides a detailed description of non-bibliographic aspects of a text, specifically the languages and sublanguages used, the situation in which it was produced, the participants and their setting.
- `<revisionDesc>` (revision description) summarizes the revision history for a file.

A corpus or collection of texts with many shared characteristics may have one header for the corpus and individual headers for each component of the corpus. In this case the `type` attribute indicates the type of header. `<teiHeader type="corpus"/>` introduces the header for corpus-level information.

Some of the header elements contain running prose which consists of one or more `<p>`s. Others are grouped:
Elements whose names end in *Stmt* (for statement) usually enclose a group of elements recording some structured information.

Elements whose names end in *Decl* (for declaration) enclose information about specific encoding practices.

Elements whose names end in *Desc* (for description) contain a prose description.

### 15.1 The File Description

The `<fileDesc>` element is mandatory. It contains a full bibliographic description of the file with the following elements:

- `<titleStmt>` (title statement) groups information about the title of a work and those responsible for its content.
- `<editionStmt>` (edition statement) groups information relating to one edition of a text.
- `<extent>` (extent) describes the approximate size of a text stored on some carrier medium or of some other object, digital or non-digital, specified in any convenient units.
- `<publicationStmt>` (publication statement) groups information concerning the publication or distribution of an electronic or other text.
- `<seriesStmt>` (series statement) groups information about the series, if any, to which a publication belongs.
- `<notesStmt>` (notes statement) collects together any notes providing information about a text additional to that recorded in other parts of the bibliographic description.
- `<sourceDesc>` (source description) describes the source(s) from which an electronic text was derived or generated, typically a bibliographic description in the case of a digitized text, or a phrase such as born digital for a text which has no previous existence.

A minimal TEI header has the following structure:

```xml
<teiHeader>
  <fileDesc>
    <!-- [ bibliographic description of the digital resource ] -->
    <titleStmt>
    <!-- [ information about how the resource is distributed ] -->
    <publicationStmt>
    <!-- [ information about the sources from which the digital resource is derived ] -->
    </sourceDesc>
  </fileDesc>
</teiHeader>
```

#### 15.1.1 The Title Statement

The following elements can be used in the `<titleStmt>` to provide information about the title of a work and those responsible for its content:

- `<title>` (title) contains a title for any kind of work.
- `<author>` (author) in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority.
- `<respStmt>` (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to
15.1 The File Description

encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work.

The title of a digital resource derived from a non-digital original may be similar to that of its source but should be distinct from it, for example: [title of source]: TEI XML edition or A machine readable version of: [title of source]

The generic <respStmt> element may be used to indicate any kind of responsibility, ranging from a funder or sponsor to an illustrator or editor. It contains the following subcomponents: <resp> (responsibility) contains a phrase describing the nature of a person’s intellectual responsibility, or an organization’s role in the production or distribution of a work. <name> (name, proper noun) contains a proper noun or noun phrase.

Example:

<titleStmt>
<title>Two stories by Edgar Allen Poe</title>
<author>Poe, Edgar Allen (1809-1849)</author>
<respStmt>
<resp>TEI encoding</resp>
<name>James D. Benson</name>
</respStmt>
<respStmt>
<resp>Funding</resp>
<name>Getty Foundation</name>
</respStmt>
</titleStmt>

15.1.2 The Edition Statement

The <editionStmt> groups information relating to one edition of the digital resource (where edition is used as elsewhere in bibliography), and may include the following elements: 
<edition> (edition) describes the particularities of one edition of a text.
<respStmt> (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work.

Example:

<editionStmt>
<edition n=U2>Third draft, substantially revised</edition>
<date>1987</date>
</editionStmt>

Determining exactly what constitutes a new edition of an electronic text is left to the encoder.

15.1.3 The Extent Statement

The <extent> statement describes the approximate size of the digital resource.

Example:

<extent>15 Mb</extent>

15.1.4 The Publication Statement

The <publicationStmt> is mandatory. It may contain a simple prose description or groups of the elements described below:
<publisher> (publisher) provides the name of the organization responsible for the publication or distribution of a bibliographic item.

<distributor> (distributor) supplies the name of a person or other agency responsible for the distribution of a text.

At least one of these elements must be present, unless the entire publication statement is in prose. The following elements may occur within them:

<pubPlace> (publication place) contains the name of the place where a bibliographic item was published.

<address> (address) contains a postal address, for example of a publisher, an organization, or an individual.

<addrLine> (address line) contains one line of a postal address.

<idno> (identifier) supplies any form of identifier used to identify some object, such as a bibliographic item, a person, a title, an organization, etc. in a standardized way.

<availability> (availability) supplies information about the availability of a text, for example any restrictions on its use or distribution, its copyright status, any licence applying to it, etc.

<licence> contains information about a licence or other legal agreement applicable to the text.

<date> (date) contains a date in any format.

Example:

<publicationStmt>
<publisher>University of Victoria Humanities Computing and Media Centre</publisher>
<pubPlace>Victoria, BC</pubPlace>
<date>2011</date>
<availability status="restricted">
  <licence target="http://creativecommons.org/licenses/by-sa/3.0/">
    Distributed under a Creative Commons Attribution-ShareAlike 3.0 Unported License
  </licence>
</availability>
</publicationStmt>

15.1.5 Series and Notes Statements

The <seriesStmt> element groups information about the series, if any, to which a publication belongs. It may contain <title>, <idno>, or <respStmt> elements.

The <notesStmt>, if used, contains one or more <note> elements which contain a note or annotation. Some information found in the notes area in conventional bibliography has been assigned specific elements in the TEI scheme.

15.1.6 The Source Description

The <sourceDesc> is a mandatory element which records details of the source or sources from which the computer file is derived. It may contain simple prose or a bibliographic citation, using one or more of the following elements:

<bib> (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.

<listBib> (citation list) contains a list of bibliographic citations of any kind.

Examples:

<sourceDesc>
<bib>The first folio of Shakespeare, prepared by Charlton Hinman (The Norton
15.2 The Encoding Description

The `<encodingDesc>` element specifies the methods and editorial principles which governed the transcription of the text. Its use is highly recommended. It may be prose description or may contain more specialized elements chosen from the following list:

- `<projectDesc>` (project description) describes in detail the aim or purpose for which an electronic file was encoded, together with any other relevant information concerning the process by which it was assembled or collected.
- `<samplingDecl>` (sampling declaration) contains a prose description of the rationale and methods used in selecting texts, or parts of a text, for inclusion in the resource.
- `<editorialDecl>` (editorial practice declaration) provides details of editorial principles and practices applied during the encoding of a text.
- `<tagsDecl>` (tagging declaration) provides detailed information about the tagging applied to a document.
- `<refsDecl>` (references declaration) specifies how canonical references are constructed for this text.
- `<listPrefixDef>` (list of prefix definitions) contains a list of definitions of prefixing schemes used in `teidata.pointer` values, showing how abbreviated URIs using each scheme may be expanded into full URIs.
- `<prefixDef>` (prefix definition) defines a prefixing scheme used in `teidata.pointer` values, showing how abbreviated URIs using the scheme may be expanded into full URIs.
- `<classDecl>` (classification declarations) contains one or more taxonomies defining any classificatory codes used elsewhere in the text.
- `<charDecl>` (character declarations) provides information about nonstandard characters and glyphs.

15.2.1 Project Description and Sampling Declaration

Examples of `<projectDesc>` and `<samplingDecl>`:

```
<encodingDesc>
  <projectDesc>
    <p>Texts collected for use in the Claremont Shakespeare Clinic, June 1990. </p>
  </projectDesc>
</encodingDesc>
```

```
<encodingDesc>
  <samplingDecl>
    51
  </samplingDecl>
</encodingDesc>
```
15.2.2 Editorial Declarations
The \texttt{editorialDecl} contains a prose description of the practices used when encoding the text. Typically this description should cover such topics as the following, each of which may conveniently be given as a separate paragraph:

\textbf{correction} how and under what circumstances corrections have been made in the text.

\textbf{normalization} the extent to which the original source has been regularized or normalized.

\textbf{quotation} what has been done with quotation marks in the original – have they been retained or replaced by entity references, are opening and closing quotes distinguished, etc.

\textbf{hyphenation} what has been done with hyphens (especially end-of-line hyphens) in the original – have they been retained, replaced by entity references, etc.

\textbf{segmentation} how has the text has been segmented, for example into sentences, tone-units, graphemic strata, etc.

\textbf{interpretation} what analytic or interpretive information has been added to the text.

Example:

\begin{verbatim}
<editorialDecl>
<p>The part of speech analysis applied throughout section 4 was added by hand and has not been checked.</p>
<p>Errors in transcription controlled by using the WordPerfect spelling checker.</p>
<p>All words converted to Modern American spelling using Webster's 9th Collegiate dictionary.</p>
</editorialDecl>
\end{verbatim}

The full TEI Guidelines provide specialized elements for each of the topics above; these are not however included in TEI simplePrint.

15.2.3 Tagging Declaration
When it does not consist simply of a prose description, the \texttt{tagsDecl} element may contain a number of more specialized elements providing additional information about how the document concerned has been marked up. The following elements may be used:

\texttt{rendition} (rendition) supplies information about the rendition or appearance of one or more elements in the source text.

\texttt{namespace} (namespace) supplies the formal name of the namespace to which the elements documented by its children belong.

\texttt{tagUsage} (element usage) documents the usage of a specific element within a specified document.

Here is a simple example, showing how these elements may be used. It indicates the number of times the elements \texttt{hi} and \texttt{title} from the TEI namespace have been used in the document. It also documents how the way that the source document was originally printed has been represented using TEI tagging:
The `<rendition>` elements here contain fragments expressed in the W3C standard Cascading Stylesheets language (CSS). Their function here is to associate the particular styles concerned with an identifier (for example `rend-bo`) which can then be pointed to from elsewhere within the document by means of the `rendition` attribute mentioned in section 3.5.1. Changes of Typeface, etc. above. To indicate, for example, that a particular name in the document was rendered in a bold font it might be tagged `<name rendition="#rend-bo">`. The `selector` attribute used in the preceding example is used to indicate once for all a default rendition value to be associated with several elements: in this example, unless otherwise indicated, it is assumed that the content of each `<hi>` and each `<title>` element was originally rendered using an italic font.

For TEI simplePrint, a large set of such rendition definitions has been predefined. The encoder is not therefore required to supply any detailed declarations, but can refer to the predefined list using the following list:

- `simple:allcaps` all capitals
- `simple:blackletter` black letter or gothic typeface
- `simple:bold` bold typeface
- `simple:bottombraced` marked with a brace under the bottom of the text
- `simple:boxed` border around the text
- `simple:centre` centred text
- `simple:cursive` cursive typeface
- `simple:display` block display
- `simple:doublestrikethrough` strikethrough with double line
- `simple:doubleunderline` underlined with double line
- `simple:dropcap` initial letter larger or decorated
- `simple:float` floated out of main flow
- `simple:hyphen` with a hyphen here (e.g. in line break)
- `simple:inline` inline rendering
- `simple:justify` justified text
- `simple:italic` italic typeface
- `simple:larger` larger type
- `simple:left` aligned to the left or left-justified
simple:leftbraced  marked with a brace on the left side of the text

simple:letterspace  larger-than-normal spacing between letters, usually for emphasis

simple:literal  fixed-width typeface, spacing preserved

simple:normalstyle  upright shape and default weight of typeface

simple:normalweight  normal typeface weight

simple:right  aligned to the right or right-justified

simple:rightbraced  marked with a brace to the right of the text

simple:rotateleft  rotated to the left

simple:rotateright  rotated to the right

simple:smallcaps  small caps

simple:smaller  smaller type

simple:strikethrough  strikethrough

simple:subscript  subscript

simple:superscript  superscript

simple:topbraced  marked with a brace above the text

simple:typewriter  fixed-width typeface, like typewriter

simple:underline  underlined with single line

simple:wavyunderline  underlined with wavy line

The simple: prefix used here must be mapped to a location at which the full rendition declaration can be found, by default the XML source of the present document.

Full details of the way these elements may be used are provided in the relevant section of the TEI Guidelines (http://www.tei-c.org/release/doc/tei-p5-doc/en/html/HD.html#HD57).

15.2.4 Reference, Prefix, and Classification Declarations

The <refsDecl> element is used to document the way in which any standard referencing scheme built into the encoding works. In its simplest form, it consists of prose description.

Example:

```xml
<refsDecl>
  <p>The @n attribute on each <div> element contains the canonical reference for each division in the form XX.yyy where XX is the book number in roman numeral and yyy is the section number in arabic.</p>
  <p>Milestone tags refer to the edition of 1830 as E30 and that of 1850 as E50.</p>
</refsDecl>
```

The <listPrefixDef> element contains one or more <prefixDef> elements, each defining a prefix which has been used to abbreviate references to other documents, for example as the value of a target or other pointing attribute. The definition provides information about how the prefix can be translated automatically into a full URL, as in the following example:
In this case, a pointer value in the form psn:MDH would be translated to http://www.example.com/personography.xml#MDH.

The `<classDecl>` element groups together definitions or sources for any descriptive classification schemes or taxonomies used by other parts of the header. These schemes may be defined in a number of different ways, using one or more of the following elements:

- `<taxonomy>` (taxonomy) defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.
- `<bibl>` (bibliographic citation) contains a loosely-structured bibliographic citation of which the sub-components may or may not be explicitly tagged.
- `<category>` (category) contains an individual descriptive category, possibly nested within a superordinate category, within a user-defined taxonomy.
- `<catDesc>` (category description) describes some category within a taxonomy or text typology, either in the form of a brief prose description or in terms of the situational parameters used by the TEI formal `<textDesc>`.

In the simplest case, the taxonomy may be defined by a bibliographic reference, as in the following example:

```xml
<classDecl>
  <taxonomy xml:id="LC-SH">
    <bibl/Library of Congress Subject Headings </bibl>
  </taxonomy>
</classDecl>
```

Alternatively, or in addition, the encoder may define a special purpose classification scheme, as in the following example:

```xml
<taxonomy xml:id="B">
  <bibl>Brown Corpus</bibl>
  <category xml:id="B.A">
    <catDesc>Press Reportage</catDesc>
    <category xml:id="B.A1">
      <catDesc>Daily</catDesc>
    </category>
    <category xml:id="B.A2">
      <catDesc>Sunday</catDesc>
    </category>
    <category xml:id="B.A3">
      <catDesc>National</catDesc>
    </category>
    <category xml:id="B.A4">
      <catDesc>Provincial</catDesc>
    </category>
    <category xml:id="B.A5">
      <catDesc>Political</catDesc>
    </category>
    <category xml:id="B.A6">
      <catDesc>Sports</catDesc>
    </category>
  </category>
</taxonomy>
```
Linkage between a particular text and a category within such a taxonomy is made by means of the `<catRef>` element within the `<textClass>` element, as described in the next section.

### 15.2.5 The character declaration

As mentioned in section 5.2, *Formulae, Codes, and Special Characters* above, the element `<g>` is used to indicate the presence of a nonstandard character or glyph in a transcription, and to reference a definition or description of it in the Header. These definitions are provided by means of the following specialised elements given within the `<charDecl>` component of the `<encodingDesc>`:

- `<char>` (character) provides descriptive information about a character.
- `<glyph>` (character glyph) provides descriptive information about a character glyph.
- `<desc>` (description) contains a short description of the purpose, function, or use of its parent element, or when the parent is a documentation element, describes or defines the object being documented.
- `<mapping>` (character mapping) contains one or more characters which are related to the parent character or glyph in some respect, as specified by the `type` attribute.

For example, the alchemical symbol for air might be encoded where it appears in a text using a `<g>` element, whose `ref` attribute might have a value `#air` to link to the following simple definition for the symbol concerned:

```xml
<char xml:id="air">
  <unicodeProp name="Name" value="ALCHEMICAL SYMBOL FOR AIR"/>
  <mapping type="standard"/>
</char>
```

### 15.3 The Profile Description

The `<profileDesc>` element gathers together information about various descriptive aspects of a text. It has the following optional components:

- `<creation>` (creation) contains information about the creation of a text.
- `<abstract>` contains a summary or formal abstract prefixed to an existing source document by the encoder.
- `<particDesc>` (participation description) describes the identifiable speakers, voices, or other participants in any kind of text or other persons named or otherwise referred to in a text, edition, or metadata.
- `<settingDesc>` (setting description) describes the setting or settings within which a language interaction takes place, or other places otherwise referred to in a text, edition, or metadata.
15.3 The Profile Description

<langUsage> (language usage) describes the languages, sublanguages, registers, dialects, etc. represented within a text.
<textClass> (text classification) groups information which describes the nature or topic of a text in terms of a standard classification scheme, thesaurus, etc.

The <creation> element documents where a work was created, even though it may not have been published or recorded there:
Example:

<creation>
  <date when="1992-08">August 1992</date>
  <name type="place">Taos, New Mexico</name>
</creation>

The <abstract> element may be used to provide a brief summary or abstract of the document concerned. It is most usually applied to texts born digital:

<profileDesc>
  <abstract>
    <p>This paper is a draft studying various aspects of using the TEI as a reference serialization framework for LMF. Comments are welcome to bring this to a useful document for the community.</p>
  </abstract>
</profileDesc>

The <particDesc> element is used to list descriptive information about the real or fictional participants in a text, for example the characters in a novel or a play. It contains at least one <listPerson> element, which contains individual <person> elements.

The <listPerson> (list of persons) contains a list of descriptions, each of which provides information about an identifiable person or a group of people, for example the participants in a language interaction, or the people referred to in a historical source.

The <person> (person) provides information about an identifiable individual, for example a participant in a language interaction, or a person referred to in a historical source.

For example:

<profileDesc>
  <particDesc>
    <listPerson>
      <person xml:id="OPI">
        <p>
          <name>Dr Opimian</name>: named for the famous Roman fine wine.
        </p>
      </person>
      <person xml:id="GRM">
        <p>
          <name>Mr Gryll</name>: named for the mythical Gryllus, one of Ulysses' sailors transformed by Circe into a pig, who argues that he was happier in that state than as a man.
        </p>
      </person>
    </listPerson>
  </particDesc>
</profileDesc>

In the same way, the <settingDesc> element can be used to list descriptive information about the real or fictional places mentioned in a text. It contains at least one <listPlace> element, which contains individual <place> elements.
(list of places) contains a list of places, optionally followed by a list of relationships (other than containment) defined amongst them.

(place) contains data about a geographic location

For example:

```xml
<profileDesc>
  <settingDesc>
    <ListPlace>
      <head>Houses mentioned in <title>Pride and Prejudice</title>
    </head>
    <place xml:id="NETF1">
      <p>
        <name>Netherfield Park</name>: home of the Bingleys
      </p>
    </place>
    <place xml:id="PEMB1">
      <p>
        <name>Pemberley</name>: home of Mr Darcy
      </p>
    </place>
  </ListPlace>
</settingDesc>
</profileDesc>
```

The full TEI Guidelines provide a rich range of additional elements to define more structured information about persons and places; these are not however available in TEI Simple.

The `<langUsage>` element is useful where a text contains many different languages. It may contain `<language>` elements to document each particular language used:

`<language>` (language) characterizes a single language or sublanguage used within a text.

For example, a text containing predominantly text in French as spoken in Quebec, but also smaller amounts of British and Canadian English might be documented as follows:

```xml
<langUsage>
  <language ident="fr-CA" usage="60">Québecois</language>
  <language ident="en-CA" usage="20">Canadian Business English</language>
  <language ident="en-GB" usage="20">British English</language>
</langUsage>
```

The `<textClass>` element classifies a text. This may be done with reference to a classification system locally defined by means of the `<classDecl>` element, or by reference to some externally defined established scheme such as the Universal Decimal Classification. Texts may also be classified using lists of keywords, which may themselves be drawn from locally or externally defined control lists. The following elements are used to supply such classifications:

`<classCode>` (classification code) contains the classification code used for this text in some standard classification system.

`<catRef>` (category reference) specifies one or more defined categories within some taxonomy or text typology.

`<keywords>` (keywords) contains a list of keywords or phrases identifying the topic or nature of a text.

The simplest way of classifying a text is by means of the `<classCode>` element. For example, a text with classification 410 in the Universal Decimal Classification might be documented as follows:

```xml
<classCode scheme="http://www.udc.org">410</classCode>
```
When a classification scheme has been locally defined using the `<taxonomy>` element discussed in the preceding subsection, the `<catRef>` element should be used to reference it. To continue the earlier example, a work classified in the Brown Corpus as Press reportage - Sunday and also as Religion might be documented as follows:

```xml
<catRef target="#B.A3 #B.D"/>
```

The element `<keywords>` contains one or more keywords or phrases identifying the topic or nature of a text, each tagged as a `<term>`. As usual, the attribute `scheme` identifies the source from which these terms are taken. For example, if the LC Subject Headings are used, following declaration of that classification system in a `<taxonomy>` element as above:

```xml
<textClass>
  <keywords scheme="#LCSH">
    <term>English literature</term>
    <term>History and criticism</term>
    <term>Data processing.</term>
  </keywords>
</textClass>
```

Multiple classifications may be supplied using any of the mechanisms described in this section.

### 15.4 Other forms of metadata

The TEI header was one of the first attempts to provide a full range of metadata elements, but it is by no means the only standard now used for this purpose. To facilitate the management of large digital collections and to simplify interoperability of TEI and non-TEI resources, the following element may be found useful: `<xenoData>` (non-TEI metadata) provides a container element into which metadata in non-TEI formats may be placed.

A typical use for this element might be to store a set of descriptors conforming to the Dublin Core standard in the TEI header rather than to generate them automatically from the corresponding TEI elements. For examples and discussion, see the TEI Guidelines at http://www.tei-c.org/release/doc/tei-p5-doc/en/html/HD.html#HD9

### 15.5 The Revision Description

The `<revisionDesc>` element provides a change log in which each significant change made to a text may be recorded. It is always the last element in a `<teiHeader>` and contains the following elements:

- `<change>` (change) documents a change or set of changes made during the production of a source document, or during the revision of an electronic file.
- `<listChange>` groups a number of change descriptions associated with either the creation of a source text or the revision of an encoded text.

Each `<change>` element contains a brief description of a significant change. The attributes `when` and `who` may be used to identify when the change was carried out and the person responsible for it.

It is good practice (but not required) to group changes together within a `<listChange>` element.

Example:
In a production environment it will usually be found preferable to use some kind of automated system to track and record changes. Many such version control systems, as they are known, can also be configured to update the TEI header of a file automatically.

16 The Simple Processing Model

Unlike most other TEI customizations, TEI simplePrint includes documentation of the intended processing associated with the majority of elements. As noted above, the TEI provides components such as the rendition attribute to indicate the appearance of particular parts of a document in the non-digital source from which it is derived. With TEI simplePrint, it is also possible to indicate how in general an element should be processed, in particular its intended appearance when processed for display on a screen or on paper. This ability derives from a number of capabilities recently added to the TEI architecture for the specification of processing, which were developed as part of the project that defined the TEI simplePrint schema.

The key feature of this Processing Model is a notation that allows the encoder to associate each element with one or more categories, which we call its behaviours. In addition, the Processing Model indicates how the element should be rendered, possibly differently in differing circumstances, using the W3C Cascading Style Sheets (CSS) mentioned above. It is consequently much easier to develop processors for documents conforming to TEI simplePrint, since the complexity of the task is much reduced.

Twenty-five different behaviours are currently defined by the TEI Processing Model. Their names indicate informally the categorization concerned, and should be readily comprehensible for most programmers. The following table indicates the TEI simplePrint elements associated with each:

<table>
<thead>
<tr>
<th>Behaviour</th>
<th>Used by</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternate choice date</td>
<td></td>
<td>support display of alternative visualizations, for example by displaying the preferred content, by displaying both in parallel, or by toggling between the two.</td>
</tr>
<tr>
<td>anchor anchor</td>
<td></td>
<td>create an identifiable anchor point in the output.</td>
</tr>
<tr>
<td>block anchor address addrLine argument back body byline closer dateline div docTitle epigraph figure floatingText formula front fw group head imprimatur l lg listBibl note opener postscript q quote role roleDesc salute signed sp speaker spGrp stage titlePage titlePart trailer</td>
<td></td>
<td>create a block structure</td>
</tr>
<tr>
<td>body text</td>
<td></td>
<td>create the body of a document</td>
</tr>
<tr>
<td>break cb lb pb</td>
<td></td>
<td>create a line, column, or page break according to the value of type</td>
</tr>
<tr>
<td>cell cell</td>
<td></td>
<td>create a table cell</td>
</tr>
</tbody>
</table>
show the content, with an indication of the source
start a new output document
show a character by looking up reference to a chardesc at the given URI
if URL is present, use it to display graphic, else display a placeholder image
creates a heading
create hyperlink
create a list
create a list item
create metadata section
create a note, often out of line, depending on the value of place; could be margin, footnote, endnote, inline
do nothing, do not process children
create a paragraph out of content
create a table row
create a new section of the output document
create a table
create literal text
create document title

Full documentation of the Processing Model is provided in section http://www.tei-c.org/release/doc/tei-p5-doc/en/html/TD.html#TDPM of the TEI Guidelines, and we do not describe it further here.

17 The TEI simplePrint schema

Like other TEI customizations, TEI simplePrint is defined by reference to the TEI Guidelines. The following reference documentation provides formal specifications for each element, model class, attribute class, macro and datatype it uses. These concepts are further explained in the TEI Guidelines.

Specifications are provided here for each component which has been modified for inclusion in TEI simplePrint. Almost every textual element has been modified, if only to include a processing model component. Note that the cross references included in these specifications are to the section of the full TEI Guidelines where the subject is treated, and not to sections of the present document.
17.1 Elements

<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the model.resource class. Multiple <TEI> elements may be combined within a <TEI> (or <teiCorpus>) element.

Module textstructure

Attributes

  - att.global.responsibility
    * @cert
    * @resp
  - att.global.source
    * @source
- att.typed
The `<ab>` element may be used at the encoder’s discretion to mark any component-level elements in a text for which no other more specific appropriate markup is defined. Unlike paragraphs, `<ab>` may nest and may use the `type` and `subtype` attributes.

Example

```xml
<div type="book" n="Genesis">
    <div type="chapter" n="1">
        <ab>In the beginning God created the heaven and the earth.</ab>
        <ab>And the earth was without form, and void; and</ab>
    </div>
</div>
```
darkness was upon the face of the deep. And the
spirit of God moved upon the face of the waters.

<ab>And God said, Let there be light: and there was light.</ab>
</div>
</div>

**Schematron** <sch:rule context="tei:ab"> <sch:report test="(ancestor::tei:l or ancestor::tei:lg) and not( ancestor::tei:floatingText |parent::tei:figure |parent::tei:note )"> Abstract model violation: Lines may not contain higher-level divisions such as p or ab, unless ab is a child of figure or note, or is a descendant of floatingText. </sch:report> </sch:rule>

**Content model**

```xml
<content>
  <macroRef key="macro.abContent"/>
</content>
```

**Schema Declaration**

```
element ab
{
  att.global.attributes,
  att.typed.attributes,
  att.fragmentable.attributes,
  att.written.attributes,
  att.cmc.attributes,
  macro.abContent}
```

**Processing Model**

```
<model behaviour="paragraph"/>
```

**<abbr>** (abbreviation) contains an abbreviation of any sort. [3.6.5. Abbreviations and Their Expansions]

**Module core**

**Attributes**

- **att.global**
  - @xml:id
  - @n
  - @xml:lang
  - @xml:base
  - @xml:space
  - att.global.rendition
    * @rendition
  - att.global.linking
    * @corresp
    * @next
    * @prev
  - att.global.analytic
    * @ana
  - att.global.facs

Note This element should be used only to mark the name of the actor as given in the source. Chapter 14. Names, Dates, People, and Places discusses ways of marking the components of names, and also of associating names with biographical information about a person.

Example

```xml
<castItem>
  <role>Mathias</role>
  <roleDesc>the Burgomaster</roleDesc>
  <actor ref="https://en.wikipedia.org/wiki/Henry_Irving">Mr. Henry Irving</actor>
</castItem>
```

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
<element actor
  { 
    att.global.attributes,
    att.canonical.attributes,
    attribute sex { list { + } }?,
    attribute gender { list { + } }?,
    macro.phraseSeq}
```

Processing Model

```xml
<model behaviour="inline"/>
```

<add> (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector. [3.5.3. Additions, Deletions, and Omissions]

In a diplomatic edition attempting to represent an original source, the `<add>` element should not be used for additions to the current TEI electronic edition made by editors or encoders. In these cases, either the `<corr>` or `<supplied>` element are recommended.

In a TEI edition of a historical text with previous editorial emendations in which such additions or reconstructions are considered part of the source text, the use of `<add>` may be appropriate, dependent on the editorial philosophy of the project.

**Example**

The story I am going to relate is true as to its main facts, and as to the consequences `<add place="above">of these facts</add>` from which this tale takes its title.

**Content model**

Addresses may be encoded either as a sequence of lines, or using any sequence of component elements from the \texttt{model.addrPart} class. Other non-postal forms of address, such as telephone numbers or email, should not be included within an \texttt{<address>} element directly but may be wrapped within an \texttt{<addrLine>} if they form part of the printed address in some source text.

**Example**

```
<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL</addrLine>
  <addrLine>60680 USA</addrLine>
</address>
```

**Example**

```
<addrLine>
  <ref target="tel:+1-201-555-0123">(201) 555 0123</ref>
</addrLine>
```

**Content model**

  linking: anchor
  transcr: fw

Note This element should be used for postal addresses only. Within it, the generic element
<addrLine> may be used as an alternative to any of the more specialized elements
available from the model.addrPart class, such as <street>, <postCode> etc.

Example Using just the elements defined by the core module, an address could be
represented as follows:

```xml
<address>
  <street>via Marsala 24</street>
  <postCode>40126</postCode>
  <name>Bologna</name>
  <name>Italy</name>
</address>
```
Example When a schema includes the names and dates module more specific elements such as country or settlement would be preferable over generic <name>:

```
<address>
  <street>via Marsala 24</street>
  <postCode>40126</postCode>
  <settlement>Bologna</settlement>
  <country>Italy</country>
</address>
```

Example

```
<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL 60680</addrLine>
  <addrLine>USA</addrLine>
</address>
```

Example

```
<address>
  <country key="FR"/>
  <settlement type="city">Lyon</settlement>
  <postCode>69002</postCode>
  <district type="arrondissement">IIème</district>
  <district type="quartier">Perrache</district>
  <street>
    <num>30</num>, Cours de Verdun
  </street>
</address>
```

Content model

**transcr**
- `fw`, `subst`, `supplied`

**verse**
- `rhyme`, `character data`

**Note** Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes `key` or `ref` may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource.

In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as `Unknown` or `Anonymous`. When the appropriate TEI modules are in use, it may also
contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.

Example

```xml
<author>British Broadcasting Corporation</author>
<author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de (1634–1693)</author>
<author>Anonymous</author>
<author>Bill and Melinda Gates Foundation</author>
<author><persName>Beaumont, Francis</persName> and <persName>John Fletcher</persName></author>
<orgName key="BBC">British Broadcasting Corporation</orgName>: Radio 3 Network</author>
```

Schematron `<sch:rule context="tei:*[@calendar]"> <sch:assert test="string-length(normalize-space(.)) gt 0"> @calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert> </sch:rule>`

Content model

```xml
<content>
<macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element author {
    att.global.attributes,
    att.naming.attributes,
    att.datable.attributes,
    attribute calendar { list { + } }?,
    macro.phraseSeq}
```

Processing Model

```xml
<model predicate="ancestor::teiHeader" behaviour="omit"/>
<model behaviour="inline"/>
```

<availability> (availability) supplies information about the availability of a text, for example any restrictions on its use or distribution, its copyright status, any licence applying to it, etc. [2.2.4. Publication, Distribution, Licensing, etc.]

}
```

(back matter) contains any appendixes, etc. following the main part of a text.

Module textstructure
Attributes  • att.global
  • @xml:id
  • @n
  • @xml:lang
Because cultural conventions differ as to which elements are grouped as back matter and which as front matter, the content models for the `<back>` and `<front>` elements are identical.

**Example**

```xml
<back>
  <div type="appendix">
    <head>The Golden Dream or, the Ingenuous Confession</head>
    <p>TO shew the Depravity of human Nature, and how apt the Mind is to be misled by Trinkets and false Appearances, Mrs. Two-Shoes does acknowledge, that after she became rich, she had like to have been, too fond of Money
    <!-- .... -->
  </div>
</back>

<!-- ... -->
<front>
  <div type="epistle">
    <head>A letter from the Printer, which he desires may be inserted</head>
    <p>Sir.</p>
    <p>I have done with your Copy, so you may return it to the Vatican, if
```
The Books usually read by the Scholars of Mrs Two-Shoes are these and are sold at Mr Newbery’s at the Bible and Sun in St Paul’s Church-yard.

- The Christmas Box, Price 1d.
- The History of Giles Gingerbread, 1d.
- A Curious Collection of Travels, selected from the Writers of all Nations, 10 Vol, Pr. bound 1l.

By the KING’s Royal Patent, Are sold by J. NEWBERY, at the Bible and Sun in St. Paul’s Church-Yard.

- Dr. James’s Powders for Fevers, the Small-Pox, Measles, Colds, 6c. 2s. 6d
- Dr. Hooper’s Female Pills, 1s.

character data

Note When a single page is being cited, use the from and to attributes with an identical value. When no clear endpoint is provided, the from attribute may be used without to; for example a citation such as p. 3ff might be encoded <biblScope from="3">p. 3ff</biblScope>.

It is now considered good practice to supply this element as a sibling (rather than a child) of <imprint>, since it supplies information which does not constitute part of the imprint.

Example

<biblScope>pp 12–34</biblScope>
<biblScope unit="page" from="12" to="34"/>
<biblScope unit="volume">II</biblScope>
<biblScope unit="page">12</biblScope>

SEQUENCE minOccurs="1" maxOccurs="1">
CLASSREF key="model.global"
(byline) contains the primary statement of responsibility given for a work on its title page or at the head or end of the work. [4.2.2. Openers and Closers]

Front Matter

Module textstructure

Attributes

- @att.global
  - @xml:id
  - @n
  - @xml:lang
The byline on a title page may include either the name or a description for the document’s author. Where the name is included, it may optionally be tagged using the `<docAuthor>` element.

**Example**

```
<byline>Written by a CITIZEN who continued all the while in London. Never made publick before.</byline>
```
Example

<byline>Written from her own MEMORANDUMS</byline>

Example

<byline>By George Jones, Political Editor, in Washington</byline>

Example

<byline>BY

<docAuthor>THOMAS PHILIPOTT,</docAuthor>

Master of Arts,

(Somtimes)

Of Clare-Hall in Cambridge.</byline>

Content model

```xml
<content>
<alternate minOccurs="0" maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.gLike"/>
  <classRef key="model.phrase"/>
  <elementRef key="docAuthor"/>
  <classRef key="model.global"/>
</alternate>
</content>
```

Schema Declaration

```xml
element byline
{
  att.global.attributes,
  att.cmc.attributes,
  ( text | model.gLike | model.phrase | docAuthor | model.global )*}
```

Processing Model

```xml
<model behaviour="block"/>
```

(character) represents a character. 18.1. Linguistic Segment Categories

Module analysis

Attributes

Contained by: castGroup, castList

May contain:
core: cb, gap, head, lb, milestone, note, pb

drama: castGroup, castItem, roleDesc

figures: figure

linking: anchor

textstructure: trailer

transcr: fw

Note: The rend attribute may be used, as here, to indicate whether the grouping is indicated by a brace, whitespace, font change, etc.

Note that in this example the role description friends of Mathias is understood to apply to both roles equally.

Example

```xml
<castGroup rend="braced">
  <castItem>
    <role>Walter</role>
    <actor>Mr Frank Hall</actor>
  </castItem>
  <castItem>
    <role>Hans</role>
    <actor>Mr F.W. Irish</actor>
  </castItem>
  <roleDesc>friends of Mathias</roleDesc>
</castGroup>
```

Content model

```xml
<content>
  <sequence minOccurs="1" maxOccurs="1">

  att.global.attributes,
  ( ( catDesc+ | ( model.descLike | equiv | gloss )* ), category* )
}
```

<cb> (column beginning) marks the beginning of a new column of a text on a multi-column page. [3.11.3. Milestone Elements]
May contain Empty element

Note On this element, the global \( n \) attribute indicates the number or other value associated with the column which follows the point of insertion of this \(<cb>\) element. Encoders should adopt a clear and consistent policy as to whether the numbers associated with column breaks relate to the physical sequence number of the column in the whole text, or whether columns are numbered within the page. The \(<cb>\) element is placed at the head of the column to which it refers.
Example  Markup of an early English dictionary printed in two columns:

```
<cb n="1"/>
<entryFree>
  <form>Well</form>, <sense>a Pit to hold Spring-Water</sense>:
  <sense>In the Art of <hi rend="italic">War</hi>, a Depth the Miner
  sinks into the Ground, to find out and disappoint the Enemies Mines,
  or to prepare one</sense>.
</entryFree>
<entryFree>To <form>Welter</form>, <sense>to wallow</sense>, or
  <sense>lie groveling</sense>.</entryFree>
<!-- remainder of column -->
<cb n="2"/>
<entryFree>
  <form>Wey</form>, <sense>the greatest Measure for dry Things,
  containing five Chaldron</sense>.
</entryFree>
<entryFree>
  <form>Whale</form>, <sense>the greatest of
  Sea-Fishes</sense>.
</entryFree>
```

Example
### Content model

```xml
<content>
  <macroRef key="macro.specialPara"/>
</content>
```

### Schema Declaration

```xml
element cell
{
    att.global.attributes,
    att.tableDecoration.attribute.rows,
    att.tableDecoration.attribute.cols,
    attribute role { "data" | "label" | "sum" | "total" }?,
    macro.specialPara
}
```

### Processing Model

```xml
<model behaviour="cell">
  <desc>Insert table cell. </desc>
</model>
```

### Change

`<change>` (change) documents a change or set of changes made during the production of a source document, or during the revision of an electronic file. [2.6. The Revision Description 2.4.1. Creation 12.7. Identifying Changes and Revisions]

@calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs. 

Deprecated will be removed on 2024-11-11

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Schematron <sch:rule context="tei:*[@calendar]"> 
  <sch:assert test="string-length( normalize-space(.) ) gt 0"> 
    @calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert> 
  </sch:rule>

@target (target) points to one or more elements that belong to this change.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

character data

Note The who attribute may be used to point to any other element, but will typically specify a <respStmt> or <person> element elsewhere in the header, identifying the person responsible for the change and their role in making it.

It is recommended that changes be recorded with the most recent first. The status attribute may be used to indicate the status of a document following the change documented.

Example

<titleStmt>
  <title> ... </title>
  <editor xml:id="LDB">Lou Burnard</editor>
  <respStmt xml:id="BZ">
    <resp>copy editing</resp>
    <name>Brett Zamir</name>
  </respStmt>
</titleStmt>

<revisionDesc status="published">
  <change who="#BZ" when="2008-02-02" status="public">Finished chapter 23</change>
  <change who="#BZ" when="2008-01-02" status="draft">Finished chapter 2</change>
  <change n="P2.2" when="1991-12-21" who="#LDB">Added examples to section 3</change>

Member of model.encodingDescPart

Contained by
  header: encodingDesc

May contain
  core: desc
gaiji: char glyph

Example

```
<charDecl>
  <char xml:id="aENL">
    <unicodeProp name="Name" value="LATIN LETTER ENLARGED SMALL A"/>
    <mapping type="standard">a</mapping>
  </char>
</charDecl>
```

Content model

```
<content>
  <sequence>
    <elementRef key="desc" minOccurs="0"/>
    <alternate minOccurs="1" maxOccurs="unbounded">
      <elementRef key="char"/>
      <elementRef key="glyph"/>
    </alternate>
  </sequence>
</content>
```

Schema Declaration

```
<element charDecl { att.global.attributes, ( desc?, ( char | glyph )+ ) }>
```

</choice> (choice) groups a number of alternative encodings for the same point in a text.

3.5. Simple Editorial Changes

Module core

Attributes

  • att.global
    - @xml:id
    - @n
    - @xml:lang
    - @xml:base
    - @xml:space
    - att.global.rendition
      * @rendition
Note Because the children of a `<choice>` element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel. Note also that `<choice>` elements may self-nest.

Where the purpose of an encoding is to record multiple witnesses of a single work, rather than to identify multiple possible encoding decisions at a given point, the `<app>` element and associated elements discussed in section 13.1. The Apparatus Entry, Readings, and Witnesses should be preferred.

Example An American encoding of *Gulliver’s Travels* which retains the British spelling but also provides a version regularized to American spelling might be encoded as follows.
Lastly, That, upon his solemn oath to observe all the above articles, the said man-mountain shall have a daily allowance of meat and drink sufficient for the support of <choice>
<sic>1724</sic>
<corr>1728</corr>
</choice> of our subjects, with free access to our royal person, and other marks of our <choice>
<orig>favour</orig>
<reg>favor</reg>
</choice>.

**Schematron**

```xml
<sch:rule context="tei:choice"> <sch:assert test="( tei:corr and tei:sic ) or ( tei:expan and tei:abbr ) or ( tei:reg and tei:orig )" role="ERROR"> Element "<sch:name/>" must have corresponding corr/sic, expand/abbr, reg/orig </sch:assert> </sch:rule>
```

**Content model**

```xml
<content>
<alternate minOccurs="2" maxOccurs="unbounded">
<classRef key="model.choicePart"/>
<elementRef key="choice"/>
</alternate>
</content>
```

**Schema Declaration**

```xml
element choice
{
  att.global.attributes,
  att.cmc.attributes,
  ( model.choicePart | choice ),
  ( model.choicePart | choice ),
  ( model.choicePart | choice )*
}
```

**Processing Model**

```xml
<model output="plain" predicate="sic and corr" behaviour="inline">
  <param name="content" value="corr[1]"/>
</model>
<model output="plain" predicate="abbr and expan" behaviour="inline">
  <param name="content" value="expan[1]"/>
</model>
<model output="plain" predicate="orig and reg" behaviour="inline">
  <param name="content" value="reg[1]"/>
</model>
<model predicate="sic and corr" behaviour="alternate">
  <param name="default" value="corr[1]"/>
</model>
<model predicate="abbr and expan" behaviour="alternate">
  <param name="default" value="expan[1]"/>
</model>
```
<cit> (cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example. [3.3.3. Quotation 4.3.1. Grouped Texts 10.3.5.1. Examples]

  - att.global.analytic
    * @ana
  - att.global.facs
    * @facs
  - att.global.responsibility
    * @cert
    * @resp

**Example**

```java
<code lang="JAVA"> Size fCheckbox1Size = new Size();
  fCheckbox1Size.Height = 500;
  fCheckbox1Size.Width = 500;
  xCheckbox1.setSize(fCheckbox1Size);
</code>
```
Example If all that is desired is to call attention to the fact that the copy text has been corrected, `<corr>` may be used alone:

I don't know, Juan. It's so far in the past now — how `<corr>`can we</corr> prove or disprove anyone's theories?

Example It is also possible, using the `<choice>` and `<sic>` elements, to provide an uncorrected reading:
I don't know, Juan. It's so far in the past now — how <choice>
<sic>we can</sic>
<corr>can we</corr>
</choice> prove or
disprove anyone's theories?

Content model

character data

Note This element should be used for deletion of shorter sequences of text, typically single words or phrases. The `<delSpan>` element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.

The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a `<supplied>` tag). Illegible or lost text within a deletion may be marked using the `<gap>` tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the `<gap>` element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the `<unclear>` element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way.

Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the `<certainty>` element (see 22. Certainty, Precision, and Responsibility).

There is a clear distinction in the TEI between `<del>` and `<surplus>` on the one hand and `<gap>` or `<unclear>` on the other. `<del>` indicates a deletion present in
the source being transcribed, which states the author’s or a later scribe’s intent to
cancel or remove text. <surplus> indicates material present in the source being
transcribed which should have been so deleted, but which is not in fact. <gap> or
<unclear>, by contrast, signal an editor’s or encoder’s decision to omit something or
their inability to read the source text. See sections 12.3.1.7. Text Omitted from or
Supplied in the Transcription and 12.3.3.2. Use of the gap, del, damage, unclear, and
supplied Elements in Combination for the relationship between these and other
related elements used in detailed transcription.

Example

```
<l>
  <del rend="overtyped">Mein</del> Frisch
  <del rend="overstrike" type="primary">schwebt</del>
  weht der Wind
</l>
```

Example

```
<del rend="overstrike">
  <gap reason="illegible" quantity="5"
       unit="character"/>
</del>
```

</model>
```

<desc> (description) contains a short description of the purpose, function, or use of its
parent element, or when the parent is a documentation element, describes or defines
the object being documented. [23.4.1. Description of Components]
THE TEI SIMPLEPRINT SCHEMA

- `@xml:lang`
- `@xml:base`
- `@xml:space`
- `att.global.rendition`
  * `@rendition`
- `att.global.linking`
  * `@corresp`
  * `@next`
  * `@prev`
- `att.global.analytic`
  * `@ana`
- `att.global.facs`
  * `@facs`
- `att.global.responsibility`
  * `@cert`
  * `@resp`
- `att.global.source`
  * `@source`

- `att.cmc`
  - `@generatedBy`

- `att.typed`
  - `@subtype`
  - `@type`

`@type` characterizes the element in some sense, using any convenient classification scheme or typology.

*Derived from:* `att.typed`

*Status:* Optional

*Datatype:* `teidata.enumerated`

```xml
<dataSpec module="tei" id="teidata.point" validUntil="2050-02-25">
  <desc type="deprecationInfo" versionDate="2018-09-14" xml:lang="en">Several standards bodies, including NIST in the USA, strongly recommend against ending the representation of a number with a decimal point. So instead of `<q>3.</q>` use either `<q>3</q>` or `<q>3.0</q>.`</desc>
</dataSpec>
```

*Member of:* `model.descLike` `model.labelLike`

*Contained by:* `core: add corr del desc gap graphic head hi item lg list listBibl note orig p q quote ref reg sic stage title unclear`

transcr: subst
character data

Note When used in a specification element such as `<elementSpec>`, TEI convention requires that this be expressed as a finite clause, beginning with an active verb.

Example Example of a `<desc>` element inside a documentation element.

```
<dataSpec module="tei"
    ident="teidata.point">
  <desc versionDate="2010-10-17"
    xml:lang="en">defines the data type used to express a point in cartesian space.</desc>
  <content>
    <dataRef name="token"
  </content>
  <!-- ... -->
</dataSpec>
```

Example Example of a `<desc>` element in a non-documentation element.

```
<place xml:id="KERG2">
  <placeName>Kerguelen Islands</placeName>
  <!-- ... -->
  <terrain>
    <desc>antarctic tundra</desc>
  </terrain>
  <!-- ... -->
</place>
```

Schematron A `<desc>` with a type of deprecationInfo should only occur when its parent element is being deprecated. Furthermore, it should always occur in an element that is being deprecated when `<desc>` is a valid child of that element.

```
<sch:rule context="tei:desc[@type eq 'deprecationInfo']">
  <sch:assert test="../@validUntil">Information about a deprecation should only be present in a specification element that is being deprecated: that is, only an element that
```
that has a @validUntil attribute should have a child <desc type="deprecationInfo">.</sch:assert> </sch:rule>

Content model

```xml
<content>

caracter data

Note The document author’s name often occurs within a byline, but the `<docAuthor>` element may be used whether the `<byline>` element is used or not. It should be used only for the author(s) of the entire document, not for author(s) of any subset or part of it. (Attributions of authorship of a subset or part of the document, for example of a chapter in a textbook or an article in a newspaper, may be encoded with `<byline>` without `<docAuthor>`.)

Example

```
<titlePage>
  <docTitle>
    <titlePart>Travels into Several Remote Nations of the World, in Four
Parts.</titlePart>
  </docTitle>
  <byline> By <docAuthor>Lemuel Gulliver</docAuthor>, First a Surgeon,
and then a Captain of several Ships</byline>
</titlePage>
```

Content model

```
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element docAuthor
{
  att.global.attributes,
  att.canonical.attributes,
  att.cmc.attributes,
  macro.phraseSeq}
```

Processing Model `<model behaviour="inline"/>

```
<docDate> (document date) contains the date of a document, as given on a title page or in a dateline. [4.6. Title Pages]
```

Module textstructure

Attributes
- att.global
  - @xml:id
  - @n
  - @xml:lang
  - @xml:base
  - @xml:space
  - att.global.rendition
    * @rendition
  - att.global.linking
    * @corresp
    * @next
    * @prev
Note Cf. the general <date> element in the core tag set. This specialized element is provided for convenience in marking and processing the date of the documents, since it is likely to require specialized handling for many applications. It should be used only for the date of the entire document, not for any subset or part of it.
Example

```xml
<docImprint>Oxford, Clarendon Press, <docDate>1987</docDate>
</docImprint>
```

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element docDate
{
  att.global.attributes,
  att.cmc.attributes,
  att.datable.attributes,
  att.calendarSystem.attributes,
  macro.phraseSeq
}
```

Processing Model

```xml
$model behaviour="inline"/>
```

**<docEdition>** (document edition) contains an edition statement as presented on a
title page of a document. [4.6. Title Pages]

  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element editor
{
  att.global.attributes,
  att.naming.attributes,
  att.datable.attributes,
  attribute calendar { list { + } },
  macro.phraseSeq
}
```

Processing Model

```xml
<model predicate="ancestor::teiHeader"
   behaviour="omit"/>
<model behaviour="inline"/>
```

(editorial practice declaration) provides details of editorial principles and practices applied during the encoding of a text. [2.3.3. The Editorial Practices Declaration 2.3. The Encoding Description 16.3.2. Declarable Elements]
<encodingDesc>
  <editorialDecl>
    <p>EEBO-TCP is a partnership between the Universities of Michigan and Oxford and the publisher ProQuest to create accurately transcribed and encoded texts based on the image sets published by ProQuest via their Early English Books Online (EEBO) database (http://eebo.chadwyck.com). The general aim of EEBO-TCP is to encode one copy (usually the first edition) of every monographic English-language title published between 1473 and 1700 available in EEBO.</p>
    <p>EEBO-TCP aimed to produce large quantities of textual data within the usual project restraints of time and funding, and therefore chose to create diplomatic transcriptions (as opposed to critical editions) with light-touch, mainly structural encoding based on the Text Encoding Initiative (http://www.tei-c.org).</p>
    <p>The EEBO-TCP project was divided into two phases. The 25,363 texts created during Phase 1 of the project have been released into the public domain as of 1 January 2015. Anyone can now take and use these texts for their own purposes.</p>
  </editorialDecl>
</encodingDesc>
own purposes, but we respectfully request that due credit and attribution is given to their original source.</p>

<p>Users should be aware of the process of creating the TCP texts, and therefore of any assumptions that can be made about the data.</p>

<p>Text selection was based on the New Cambridge Bibliography of English Literature (NCBEL). If an author (or for an anonymous work, the title) appears in NCBEL, then their works are eligible for inclusion. Selection was intended to range over a wide variety of subject areas, to reflect the true nature of the print record of the period. In general, first editions of works in English were prioritized, although there are a number of works in other languages, notably Latin and Welsh, included and sometimes a second or later edition of a work was chosen if there was a compelling reason to do so.</p>

<p>Image sets were sent to external keying companies for transcription and basic encoding. Quality assurance was then carried out by editorial teams in Oxford and Michigan. 5% (or 5 pages, whichever is the greater) of each text was proofread for accuracy and those which did not meet QA standards were returned to the keyers to be redone. After proofreading, the encoding was enhanced and/or corrected and characters marked as illegible were corrected where possible up to a limit of 100 instances per text. Any remaining illegibles were encoded as &lt;gap&gt;s. Understanding these processes should make clear that, while the overall quality of TCP data is very good, some errors will remain and some readable characters will be marked as illegible. Users should bear in mind that in all likelihood such instances will never have been looked at by a TCP editor.</p>

<p>The texts were encoded and linked to page images in accordance with level 4 of the TEI in Libraries guidelines.</p>

<p>Copies of the texts have been issued variously as SGML (TCP schema; ASCII text with mnemonic sdata character entities); displayable XML (TCP schema; characters represented either as UTF-8 Unicode or text strings within braces); or lossless XML (TEI P5, characters represented either as UTF-8 Unicode or TEI g elements).</p>

<p>Keying and markup guidelines are available at the Text Creation Partnership web site.</p>

**<expan>** (expansion) contains the expansion of an abbreviation.  

3.6.5. Abbreviations and Their Expansions

Module core

Attributes  

- `att.global`
  - `@xml:id`
  - `@n`
  - `@xml:lang`
  - `@xml:base`
  - `@xml:space`
  - `att.global.rendition`
    * `@rendition`
  - `att.global.linking`
    * `@corresp`
    * `@next`
    * `@prev`
Note The content of this element should be the expanded abbreviation, usually (but not always) a complete word or phrase. The <ex> element provided by the transcr module may be used to mark up sequences of letters supplied within such an expansion.
If abbreviations are expanded silently, this practice should be documented in the <editorialDecl>, either with a <normalization> element or a <p>.

Example

The address is Southmoor
<choice>
<expan>Road</expan>
<abbr>Rd</abbr>
</choice>

Example

<choice xml:lang="la">
<abbr>Imp</abbr>
<expan>Imp</expan>erator</ex>
</choice>

Content model

```
<content>
  <macroRef key="macro.phraseSeq"/>

Because cultural conventions differ as to which elements are grouped as front matter and which as back matter, the content models for the `<front>` and `<back>` elements are identical.

Example

```xml
<front>
  <epigraph>
    <quote>Nam Sibyllam quidem Cumis ego oculis meis vidi in ampulla pendere, et cum illi pueri dicerent: <q xml:lang="grc">Σίβυλλα τί θέλεις</q>; respondebat illa: <q xml:lang="grc">ἀποθανεῖν θέλω.</q>
  </quote>
</epigraph>
  <div type="dedication">
    <p>For Ezra Pound <q xml:lang="it">il miglior fabbro.</q>
  </p>
</div>
</front>
```

Example

```xml
<front>
  <div type="dedication">
    <p>To our three selves</p>
  </div>
  <div type="preface">
    <head>Author's Note</head>
    <p>All the characters in this book are purely imaginary, and if the author has used names that may suggest a reference to living persons she has done so inadvertently. ...</p>
  </div>
</front>
```

Example

```xml
<front>
  <div type="abstract">
    <head>BACKGROUND:</head>
    <p>Food insecurity can put children at greater risk of obesity because of altered food choices and nonuniform consumption patterns.</p>
  </div>
  <div>
    <head>OBJECTIVE:</head>
    <p>We examined the association between obesity and both child-level food insecurity and personal food insecurity in US children.</p>
  </div>
  <div>
    <head>DESIGN:</head>
    <p>Data from 9,701 participants in the National Health and Nutrition Examination Survey, 2001-2010, aged 2 to 11 years were analyzed. Child-level food insecurity was assessed with the US Department of Agriculture's Food Security Survey Module based on eight child-specific questions. Personal food insecurity was assessed with five additional questions. Obesity was defined, using physical
```
measurements, as body mass index (calculated as kg/m2) greater than or equal to the age- and sex-specific 95th percentile of the Centers for Disease Control and Prevention growth charts. Logistic regressions adjusted for sex, race/ethnic group, poverty level, and survey year were conducted to describe associations between obesity and food insecurity.

RESULTS:

Obesity was significantly associated with personal food insecurity for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to 2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95% CI 0.51 to 1.51). Child-level food insecurity was not associated with obesity among 2- to 5-year-olds or 6- to 11-year-olds.

CONCLUSIONS:

Personal food insecurity is associated with an increased risk of obesity only in children aged 6 to 11 years. Personal food-insecurity measures may give different results than aggregate food-insecurity measures in children.

character data

Note Where running heads are consistent throughout a chapter or section, it is usually more convenient to relate them to the chapter or section, e.g. by use of the rend attribute. The <fw> element is intended for cases where the running head changes from page to page, or where details of page layout and the internal structure of the running heads are of paramount importance.

Example

<fw type="sig" place="bottom">C3</fw>

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element fw
{
  att.global.attributes,

**May contain** Character data only

**Note** The name `g` is short for *gaiji*, which is the Japanese term for a non-standardized character or glyph.

**Example**

```xml
<g ref="#ctlig">ct</g>
```

This example points to a `<glyph>` element with the identifier `ctlig` like the following:

```xml
<glyph xml:id="ctlig">
<!-- here we describe the particular ct-ligature intended -->
</glyph>
```

**Example**

```xml
<g ref="#per-glyph">per</g>
```
The medieval breveigraph per could similarly be considered as an individual glyph, defined in a `<glyph>` element with the identifier `per-glyph` as follows:

```xml
<glyph xml:id="per-glyph">
  <!-- ... -->
</glyph>
```

**Content model**

```
<content> <textNode/></content>
```

  - @generatedBy

@reason (reason) gives the reason for omission

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: cancelled (cancelled)
  - deleted (deleted)
  - editorial (editorial) for features omitted from transcription due to editorial policy
  - illegible (illegible)
  - inaudible (inaudible)
  - irrelevant (irrelevant)
  - sampling (sampling)

@agent (agent) in the case of text omitted because of damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype teidata.enumerated

Sample values include: rubbing (rubbing) damage results from rubbing of the leaf edges
  - mildew (mildew) damage results from mildew on the leaf surface
  - smoke (smoke) damage results from smoke

namesdates: person
The <gap>, <unclear>, and <del> core tag elements may be closely allied in use with the <damage> and <supplied> elements, available when using the additional tagset for transcription of primary sources. See section 12.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The <gap> tag simply signals the editors decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that text was deliberately erased or covered, should be indicated using the relevant tags, such as <del> in the case of deliberate deletion.

Example

```xml
<gap quantity="4" unit="chars" reason="illegible"/>
```

Example

```xml
<gap quantity="1" unit="essay" reason="sampling"/>
```

Example

```xml
<del>
<gap atLeast="4" atMost="8" unit="chars" reason="illegible"/>
</del>
```

Example

```xml
<gap extent="several lines" reason="lost"/>
```

Content model

```xml

```

**<graphic>** (graphic) indicates the location of a graphic or illustration, either forming part of a text, or providing an image of it. [3.10. Graphics and Other Non-textual Components 12.1. Digital Facsimiles]

**Module core**

**Attributes**

- att.global
  - @xml:id
  - @n
May contain desc

Note The mimeType attribute should be used to supply the MIME media type of the image specified by the url attribute.

Within the body of a text, a <graphic> element indicates the presence of a graphic component in the source itself. Within the context of a <facsimile> or <sourceDoc> element, however, a <graphic> element provides an additional digital representation of some part of the source being encoded.

Example

```xml
<figure>
  <graphic url="fig1.png/>
  <head>Figure One: The View from the Bridge</head>
  <figDesc>A Whistleresque view showing four or five sailing boats in the foreground, and a series of buoys strung out between them.</figDesc>
</figure>
```

Example

```xml
<facsimile>
  <surfaceGrp n="leaf1">
    <surface>
      <graphic url="page1.png"/>
    </surface>
    <graphic url="page2-highRes.png"/>
    <graphic url="page2-lowRes.png"/>
  </surface>
  <surfaceGrp n="leaf1" xml:id="spi001">
    <surface xml:id="spi001r">
      <graphic type="normal" subtype="thumbnail" url="spi/thumb/001r.jpg"/>
      <graphic type="normal" subtype="low-res" url="spi/normal/lowRes/001r.jpg"/>
      <graphic type="normal" subtype="high-res" url="spi/normal/highRes/001r.jpg"/>
      <graphic type="high-contrast" subtype="low-res" url="spi/contrast/lowRes/001r.jpg"/>
      <graphic type="high-contrast" subtype="high-res" url="spi/contrast/highRes/001r.jpg"/>
    </surface>

character data
Note The `<head>` element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a `<head>` element based on its structural position. A `<head>` occurring as the first element of a list is the title of that list; one occurring as the first element of a `<div>` is the title of that chapter or section.

Example The most common use for the `<head>` element is to mark the headings of sections. In older writings, the headings or *incipits* may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a `<trailer>`, as in this example:

```
<doc n="I" type="book">
  <head>\nIn the name of Christ here begins the first book of the ecclesiastical history of Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
  <div type="section">
    <head>\nIn the name of Christ here begins Book I of the history.</head>
    <p>Proposing as I do ...</p>
    <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p>
    <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer>
  </div>
</doc>
```

Example When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the `place` attribute.

```
<doc type="subsection">
  <head place="margin">Secunda conclusio</head>
  <p>\nlb n="1251"/\nhi rend="large">Potencia: habitus: et actus: recipiunt speciem ab objectis</hi>
  \n<lb n="1252"/>Probatur sic. Omne importans necessariam habitudinem ad proprium [...]
</p>
</doc>
```

Example The `<head>` element is also used to mark headings of other units, such as lists:

```
With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. <list rend="bulleted">
  <head>Connectives</head>
  <item>above</item>
  <item>accordingly</item>
  <item>across from</item>
  <item>adjacent to</item>
  <item>again</item>
  <!-- ... -->
</item>
</list>
```

Content model
<hi>(highlighted) marks a word or phrase as graphically distinct from the surrounding text, for reasons concerning which no claim is made. [3.3.2.2. Emphatic Words and Phrases [3.3.2. Emphasis, Foreign Words, and Unusual Language]

header: `<idno>`

character data

**Note** `<idno>` should be used for labels which identify an object or concept in a formal  
cataloguing system such as a database or an RDF store, or in a distributed system  
such as the World Wide Web. Some suggested values for type on `<idno>` are ISBN,  
ISSN, DOI, and URI.

**Example**

```
<idno type="ISBN">978-1-906964-22-1</idno>
<idno type="ISSN">0143-3385</idno>
<idno type="DOI">10.1000/123</idno>
<idno type="URI">http://www.worldcat.org/oclc/185922478</idno>
<idno type="URI">http://authority.nzetc.org/463/</idno>
<idno type="LT">Thomason Tract E.537(17)</idno>
<idno type="Wing">C695</idno>
<idno type="oldCat">  
  <g ref="#sym">345</g>
</idno>
```

In the last case, the identifier includes a non-Unicode character which is defined  
elsewhere by means of a `<glyph>` or `<char>` element referenced here as `#sym`.

**Content model**

Note. May contain simple prose or a sequence of chunks.

Whatever string of characters is used to label a list item in the copy text may be used as the value of the global n attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the n attribute on the <item> element is by definition synonymous with the use of the <label> element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the <label> element, not n.

Example

```xml
<list rend="numbered">
  <head>Here begin the chapter headings of Book IV</head>
  <item n="4.1">The death of Queen Clotild.</item>
  <item n="4.2">How King Lothar wanted to appropriate one third of the Church revenues.</item>
  <item n="4.3">The wives and children of Lothar.</item>
  <item n="4.4">The Counts of the Bretons.</item>
  <item n="4.5">Saint Gall the Bishop.</item>
  <item n="4.6">The priest Cato.</item>
  <item> ...</item>
</list>
```

Content model

```xml
<content>
  <macroRef key="macro.specialPara"/>
</content>
```
<keywords> (keywords) contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. The Text Classification]

Module header
Attributes

  - att.global.source
    * @source

@scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a <taxonomy> element, or by some other resource.
Status Optional
Datatype teidata.pointer

Contained by: textClass
May contain: list term
Note Each individual keyword (including compound subject headings) should be supplied as a <term> element directly within the <keywords> element. An alternative usage, in which each <term> appears within an <item> inside a <list> is permitted for backwards compatibility, but is deprecated.
If no control list exists for the keywords used, then no value should be supplied for the scheme attribute.

Example

```xml
<keywords scheme="http://classificationweb.net">
  <term>Babbage, Charles</term>
  <term>Mathematicians - Great Britain - Biography</term>
</keywords>
```

Example

```xml
<keywords>
  <term>Fermented beverages</term>
  <term>Central Andes</term>
  <term>Schinus molle</term>
  <term>Molle beer</term>
  <term>Indigenous peoples</term>
  <term>Ethnography</term>
  <term>Archaeology</term>
</keywords>
```

Content model

```xml
<content>
  <alternate>
    <elementRef key="term" minOccurs="1" maxOccurs="unbounded"/>
    <elementRef key="list"/>
  </alternate>
</content>
```

Schema Declaration

```xml
element keywords
{
  att.global.attributes,
  attribute scheme { text }?,
  ( term+ | list )
}
```

(verse line) contains a single, possibly incomplete, line of verse. [3.13.1. Core Tags for Verse 3.13. Passages of Verse or Drama 7.2.5. Speech Contents]

Example: Labels are commonly used for the headwords in glossary lists; note the use of the global xml:lang attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:

```xml
<list type="gloss" xml:lang="enm">
  <head> Vocabulary </head>
  <headLabel xml:lang="en"> Middle English </headLabel>
  <headItem xml:lang="en"> New English </headItem>
  <item> nu </item>
  <item> now </item>
  <item> loudly </item>
  <item> blooms </item>
  <item> med </item>
  <item> meadow </item>
  <item> wude </item>
  <item> wood </item>
  <item> awe </item>
  <item> ewe </item>
  <item> lows </item>
  <item> sterteth </item>
  <item> bounds, frisks (cf. <cit>
      <ref> Chaucer, K.T.644 </ref>
      <quote> a courser, <term> sterting </term> as the fyr </quote>
    </cit>
  </item>
  <item> verteth </item>
  <item> pedit </item>
  <item> murie </item>
  <item> merrily </item>
  <item> swik </item>
  <item> cease </item>
  <item> naver </item>
  <item> never </item>
</list>
```

Example: Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon’s *Autobiography*. In this usage the `<label>` element is synonymous with the `n` attribute on the `<item>` element:

```xml
I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos.
<list rend="runon" type="ordered">
  <label>(1)</label>
  <item> My first rough manuscript, without any intermediate copy, has been sent to the press. </item>
  <label>(2) </label>
</list>
```
<item>Not a sheet has been seen by any human eyes, excepting those of the author and the printer: the faults and the merits are exclusively my own.</item></list>

Example Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

<list type="gloss">
  <label>March 1757.</label>
  <item>I wrote some critical observations upon Plautus.</item>
  <label>March 8th.</label>
  <item>I wrote a long dissertation upon some lines of Virgil.</item>
  <label>June.</label>
  <item>I saw Mademoiselle Curchod — <quote xml:lang="la">Omnia vincit amor, et nos cedamus amor.</quote></item>
  <label>August.</label>
  <item>I went to Crassy, and staid two days.</item>
</list>

Note that the <label> might also appear within the <item> rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.

Example Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the <label> element appears within the <p> or <lg> element, rather than as a preceding sibling of it.

<p>[...]</p>

<lb>& n'entrer en mauvais & mal-heu.-<lb>/ré meſnage. Or des que le confente-<lb>/ment des parties y eſt le mariag eft<lb>/ arreſté, quoy que de faict il ne foit<lb>place="margin">Puiffance maritale entre les Romains.</lb></p>

In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the type attribute may be used to distinguish different categories of label.

May contain: Empty element

Note By convention, <lb> elements should appear at the point in the text where a new line starts. The n attribute, if used, indicates the number or other value associated with the text between this point and the next <lb> element, typically the sequence number of the line within the page, or other appropriate unit. This element is
intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the `<l>` element is available) except in circumstances where structural units cannot otherwise be marked.

The `type` attribute may be used to characterize the line break in any respect. The more specialized attributes `break`, `ed`, or `edRef` should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

Example This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```xml
<lb ed="1674"/> and <lb ed="1667"/> the Fruit
<lb ed="1667 1674"/> mortal tast</l>
Brought Death into the World,<lb ed="1667"/> and all<l ed="1674"/> our woe.</l>
```

Example This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The `break` attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.

```xml
<titlePart>
  <lb/>With Additions, ne-<lb break="no"/>ver before Printed.
</titlePart>
```

**Content model**
```xml
<content> <empty/> </content>
```

**Schema Declaration**
```xml
element lb
{
  att.global.attributes,
  att.typed.attributes,
  att.edition.attributes,
  att.spanning.attributes,
  att.breaking.attributes,
  att.cmc.attributes,
  empty
}
```

**Processing Model**
```xml
<model behaviour="break"
  useSourceRendition="true">
  <param name="type" value="'line'"/>
  <param name="label" value="@n"/>
</model>
```

(line group) contains one or more verse lines functioning as a formal unit, e.g. a stanza, refrain, verse paragraph, etc. 3.13.1. Core Tags for Verse 3.13. Passages of Verse or Drama 7.2.5. Speech Contents

* @resp
  - att.global.source
* @source

- att.sortable
  - @sortKey
- att.cmc
  - @generatedBy
- att.typed
  - @subtype

@type (type) describes the nature of the items in the list.

* Derived from att.typed
* Status Optional
* Datatype teidata.enumerated

Note Previous versions of these Guidelines recommended the use of type on <list> to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the rend or style attributes for these aspects of a list, while using type for the more appropriate task of characterizing the nature of the content of a list.

The formal syntax of the element declarations allows <label> tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.

- transcr: prop
transcr: prop

Note May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.

Example
<list rend="numbered">
  <item>a butcher</item>
  <item>a baker</item>
  <item>a candlestick maker, with
    <list rend="bulleted">
      <item>rings on his fingers</item>
      <item>bells on his toes</item>
    </list>
  </item>
</list>

Example

<list type="syllogism" rend="bulleted">
  <item>All Cretans are liars.</item>
  <item>Epimenides is a Cretan.</item>
  <item>ERGO Epimenides is a liar.</item>
</list>

Example

<list type="litany" rend="simple">
  <item>God save us from drought.</item>
  <item>God save us from pestilence.</item>
  <item>God save us from wickedness in high places.</item>
  <item>Praise be to God.</item>
</list>

Example The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):

<div1 type="section">
  <head>Athelstan's Ordinance</head>
  <list rend="numbered">
    <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with the stolen goods, [if he is] over twelve years and [if the value of the goods is] over eightpence.</item>
    <list rend="numbered">
      <item n="1.1">And if anyone does spare one, he is to pay for the thief with his wergild — and the thief is to be no nearer a settlement on that account — or to clear himself by an oath of that amount.</item>
      <item n="1.2">If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve].</item>
      <item n="1.3">If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever.</item>
      <item n="1.4">And if he steals after that, they are to pay for him with his wergild, or to bring him back there.</item>
      <item n="1.5">And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a
Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting.

- And if they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him down as a thief.

- And he who harbours him after that, is to pay for him with his wergild or to clear himself by an oath of that amount.

Concerning the refusal of justice. The lord who refuses justice and upholds his guilty man, so that the king is appealed to, is to repay the value of the goods and 120 shillings to the king; and he who appeals to the king before he demands justice as often as he ought, is to pay the same fine as the other would have done, if he had refused him justice.

- And the lord who is an accessory to a theft by his slave, and it becomes known about him, is to forfeit the slave and be liable to his wergild on the first occasion; if he does it more often, he is to be liable to pay all that he owns.

- And likewise any of the king's treasurers or of our reeves, who has been an accessory of thieves who have committed theft, is to liable to the same.

Concerning treachery to a lord. And we have pronounced concerning treachery to a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is afterwards convicted at the three-fold ordeal.

Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.

Example

These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross.
I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.

I, Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.

I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.

I, Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.

I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.

I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.

I, Æthelwine, bishop, have subscribed through delegates.

I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.

<listChange>

@ordered indicates whether the ordering of its child <change> elements is to be considered significant or not

Status Optional
Datatype teidata.truthValue
Default true

Contained by: creation listChange revisionDesc
May contain core: desc
header: change listChange

Note When this element appears within the <creation> element it documents the set of revision campaigns or stages identified during the evolution of the original text. When it appears within the <revisionDesc> element, it documents only changes made during the evolution of the encoded representation of that text.

Example

<revisionDesc>
  <listChange>
    <change when="1991-11-11" who="#LB"> deleted chapter 10 </change>
    <change when="1991-11-02" who="#MSM"> completed first draft </change>
  </listChange>
</revisionDesc>

Example

<profileDesc>
  <creation>
    <listChange ordered="true">
      <change xml:id="CHG-1">First stage, written in ink by a writer</change>
      <change xml:id="CHG-2">Second stage, written in Goethe's hand using pencil</change>
      <change xml:id="CHG-3">Fixation of the revised passages and further revisions by Goethe using ink</change>
      <change xml:id="CHG-4">Addition of another stanza in a different hand, probably at a later stage</change>
    </listChange>
  </creation>
</profileDesc>

244
Example

In this example, two private URI scheme prefixes are defined and patterns are provided for dereferencing them. Each prefix is also supplied with a human-readable explanation in a `<p>` element.

```xml
<listPrefixDef>
  <prefixDef ident="psn"
    matchPattern="([A-Z]+)"
    replacementPattern="personography.xml#$1">
    <p>
      Private URIs using the `<code>psn</code>` prefix are pointers to `<gi>person</gi>` elements in the personography.xml file. For example, `<code>psn:MDH</code>` dereferences to `<code>personography.xml#MDH</code>`.
    </p>
  </prefixDef>
  <prefixDef ident="bibl"
    matchPattern="([a-z]+[a-z0-9]*)"
    replacementPattern="http://www.example.com/getBibl.xql?id=$1">
    <p>
      Private URIs using the `<code>bibl</code>` prefix can be expanded to form URIs which retrieve the relevant bibliographical reference from www.example.com.
    </p>
  </prefixDef>
</listPrefixDef>
```

Content model

```xml
<content>
  <sequence>
    <elementRef key="desc" minOccurs="0" maxOccurs="unbounded"/>
    <alternate minOccurs="1" maxOccurs="unbounded">
      <elementRef key="prefixDef"/>
      <elementRef key="listPrefixDef"/>
    </alternate>
  </sequence>
</content>
```

Schema Declaration

```xml
element listPrefixDef
{
  att.global.attributes,
  ( desc*, ( prefixDef | listPrefixDef )* )
}
```
<localProp> (locally defined property) provides a locally defined character (or glyph) property. [5.2.1. Character Properties]

Module gaiji

Containability: char glyph

May contain Empty element

Note No definitive list of local names is proposed. However, the name entity is recommended as a means of naming the property identifying the recommended character entity name for this character or glyph.

Example
Content model  
<content> <empty/></content>

Schema Declaration

```xml
<localProp { att.global.attributes, att.gaijiProp.attributes, empty }>
```

**<mapping>** (character mapping) contains one or more characters which are related to the parent character or glyph in some respect, as specified by the `type` attribute.

5.2. Markup Constructs for Representation of Characters and Glyphs

*Module gaiji*

*Attributes*

- `att.global`
  - `@xml:id`
  - `@n`
  - `@xml:lang`

**Containing**: char, glyph

**May contain**:

- gaiji: g

**Character data**

**Note**: Suggested values for the `type` attribute include exact for exact equivalences, uppercase for uppercase equivalences, lowercase for lowercase equivalences, and simplified for simplified characters. The `<g>` elements contained by this element can point to either another `<char>` or `<glyph>` element or contain a character that is intended to be the target of this mapping.

**Example**

```
<mapping type="modern">r</mapping>
<mapping type="standard"></mapping>
```

**Content model**

```
<content> <macroRef key="macro.xtext"/></content>
```

**Schema Declaration**

```xml
<element mapping
{ att.global.attributes,
att.typed.attributes,
att.datable.attributes,
macro.xtext}
```

**<measure>** (measure) contains a word or phrase referring to some quantity of an object or commodity, usually comprising a number, a unit, and a commodity name. [3.6.3. Numbers and Measures]

**Module core**

character data

Example In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":

And yet it is not only
in the great line of Italian renaissance art, but even in the painterly <note place="bottom" type="gloss"
  resp="#MDMH">
  <term xml:lang="de">Malerisch</term>. This word has, in the German, two distinct meanings, one objective, a quality residing in the object, the other subjective, a mode of apprehension and creation. To avoid
confusion, they have been distinguished in English as picturesquely mentioned and painterly mentioned respectively. Style of the Dutch genre painters of the seventeenth century that drapery has this psychological significance.

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example: The global n attribute may be used to supply the symbol or number used to mark the note’s point of attachment in the source text, as in the following example:

Mevorakh b. Saadya’s mother, the matriarch of the family during the second half of the eleventh century, The alleged mention of Judah Nagid’s mother in a letter from 1071 is, in fact, a reference to Judah’s children; cf. above, nn. 111 and 54. is well known from Geniza documents published by Jacob Mann.

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

Content model

    - `@cert`
    - `@resp`
  - `att.global.source`
    - `@source`
- **att.cmc**
  - `@generatedBy`
- **att.typed**
  - `@type`
  - `@subtype`

@type indicates the type of numeric value.

*Derived from* att.typed

*Status* Optional

*Datatype* teidata.enumerated

261
Note If a different typology is desired, other values can be used for this attribute.

@value supplies the value of the number in standard form.

Status Optional

Datatype teidata.numeric

Values a numeric value.

Note The standard form used is defined by the TEI datatype teidata.numeric.

character data

Note Detailed analyses of quantities and units of measure in historical documents may also use the feature structure mechanism described in chapter 19. Feature Structures. The <num> element is intended for use in simple applications.

Example

<p>I reached <num type="cardinal" value="21">twenty-one</num> on my <num type="ordinal" value="21">twenty-first</num> birthday.</p>

<p>Light travels at <num value="3E10">3×10<hi rend="sup">10</hi> cm per second.</num></p>

      maxOccurs="unbounded"/>
  </alternate>
  <alternate minOccurs="1"
    maxOccurs="unbounded">
    <classRef key="model.personLike"/>
    <elementRef key="listPerson"/>
    <elementRef key="listOrg"/>
  </alternate>
</content>
```

Schema Declaration

```xml
element particDesc
{
  att.global.attributes,
  ( model.pLike+ | ( model.personLike | listPerson | listOrg )+ )
}
```

`<pb>` (page beginning) marks the beginning of a new page in a paginated document.

Module core

Attributes

- `att.global`
  - `@xml:id`
  - `@n`
  - `@xml:lang`
  - `@xml:base`
  - `@xml:space`
  - `att.global.rendition`
Note A `<pb>` element should appear at the start of the page which it identifies. The global `n` attribute indicates the number or other value associated with this page. This will normally be the page number or signature printed on it, since the physical sequence number is implicit in the presence of the `<pb>` element itself.

The `type` attribute may be used to characterize the page break in any respect. The more specialized attributes `break`, `ed`, or `edRef` should be preferred when the intent is to indicate whether or not the page break is word-breaking, or to note the source from which it derives.

Example Page numbers may vary in different editions of a text.

```xml
<p> ... <pb n="145" ed="ed2"/> <!-- Page 145 in edition "ed2" starts here --> ... <pb n="283" ed="ed1"/> <!-- Page 283 in edition "ed1" starts here--> ... </p>
```

Example A page break may be associated with a facsimile image of the page it introduces by means of the `facs` attribute

```xml
<body>
  <pb n="1" facs="page1.png"/> <!-- page1.png contains an image of the page; the text it contains is encoded here -->
  <p> <!-- ... -->
  </p>
  <pb n="2" facs="page2.png"/> <!-- similarly, for page 2 -->
  <p> <!-- ... -->
  </p>
</body>
```

Content model

```
<content> <empty/></content>
```

Schema Declaration

```
element pb {
  att.global.attributes,
  att.typed.attributes,
  att.edition.attributes,
  att.spanning.attributes,
  att.breaking.attributes,
  att.cmc.attributes,
  empty
}
```

Processing Model

```
<model behaviour="break" useSourceRendition="true">
  <param name="type" value="page"/>
  <param name="label" value="(concat(if(@n) then concat(@n, ' ') else ''),if(@facs) then concat('@',@facs) else '')"/>
  <outputRendition> display: block; margin-left: 4pt; color: grey; float: right; </outputRendition>
  <outputRendition scope="before">content: '[Page ';</outputRendition>
  <outputRendition scope="after">content: ']';</outputRendition>
</model>
```
(punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark. [18.1.2. Below the Word Level 18.4.2.
Lightweight Linguistic Annotation]

@force indicates the extent to which this punctuation mark conventionally separates words or phrases

Status Optional

Datatype | teidata.enumerated
Legal values are: strong the punctuation mark is a word separator
weak the punctuation mark is not a word separator

inter the punctuation mark may or may not be a word separator

@unit provides a name for the kind of unit delimited by this punctuation mark.

Status Optional
Datatype teidata.enumerated

@pre indicates whether this punctuation mark precedes or follows the unit it delimits.

Status Optional
Datatype teidata.truthValue

    - att.global.source
@role specifies a primary role or classification for the person.
  
  Status Optional
  Datatype 1–∞ occurrences of `teidata.enumerated` separated by whitespace
  
  Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as artist, employer, author, relative, or servant, each of which should be associated with a definition. Such local definitions will typically be provided by a `<valList>` element in the project schema specification.

@sex specifies the sex of the person.
  
  Status Optional
  Datatype 1–∞ occurrences of `teidata.sex` separated by whitespace
  
  Note Values for this attribute may be defined locally by a project, or they may refer to an external standard.

@gender specifies the gender of the person.
  
  Status Optional
  Datatype 1–∞ occurrences of `teidata.gender` separated by whitespace
  
  Note Values for this attribute may be defined locally by a project, or they may refer to an external standard.

@age specifies an age group for the person.
  
  Status Optional
  Datatype `teidata.enumerated`
  
  Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as infant, child, teen, adult, or senior, each of which should be associated with a definition. Such local definitions will typically be provided by a `<valList>` element in the project schema specification.

Dear Susan,

Thank you very much for the assistance splitting those logs. I’m sorry about the misunderstanding as to the size of the task. I really was not asking for help, only to borrow the axe. Hope you had fun in any case.

Sincerely yours,

Seymour

P.S. The collision occurred on 06 Jul 01.

      <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
  </sequence>
</content>
```

Schema Declaration

```xml
element postscript
{
  att.global.attributes,
  att.written.attributes,
  att.cmc.attributes,
  ( ( model.global | model.divTopPart )* ,
    model.common ,
    ( model.global | model.common )* ,
    ( ( model.divBottomPart , model.global* )* )
}
```

Processing Model `<model behaviour="block"/>`

281
\textit{\textless prefixDef \textgreater} (prefix definition) defines a prefixing scheme used in teidata.pointer values, showing how abbreviated URIs using the scheme may be expanded into full URIs.

\textbf{[17.2.3. Using Abbreviated Pointers]}

\textbf{Module header}

\textbf{Attributes}

- \textit{att.global}
  - \texttt{@xml:id}
  - \texttt{@n}
  - \texttt{@xml:lang}
  - \texttt{@xml:base}
  - \texttt{@xml:space}
  - \textit{att.global.rendition}
    * \texttt{@rendition}
  - \textit{att.global.linking}
    * \texttt{@corresp}
    * \texttt{@next}
    * \texttt{@prev}
  - \textit{att.global.analytic}
    * \texttt{@ana}
  - \textit{att.global.facs}
    * \texttt{@facs}
  - \textit{att.global.responsibility}
    * \texttt{@cert}
    * \texttt{@resp}
  - \textit{att.global.source}
    * \texttt{@source}

- \textit{att.patternReplacement}
  - \texttt{@matchPattern}
  - \texttt{@replacementPattern}

\textbf{Ident} supplies a name which functions as the prefix for an abbreviated pointing scheme such as a private URI scheme. The prefix constitutes the text preceding the first colon.

\textbf{Status} Required

\textbf{Datatype} teidata.prefix

\textbf{Note} The value is limited to teidata.prefix so that it may be mapped directly to a URI prefix.

\textbf{Contained by} header:

\textbf{May contain}

\textbf{core:} \texttt{p}

\textbf{linking:} \texttt{ab}

\textbf{Note} The abbreviated pointer may be dereferenced to produce either an absolute or a relative URI reference. In the latter case it is combined with the value of xml:base in force at the place where the pointing attribute occurs to form an absolute URI in the usual manner as prescribed by XML Base.

\textbf{Example}

282
In the context of this project, private URIs with the prefix "ref" point to elements in the project's global references.xml file.

Content model

```xml
<content>
  <classRef key="model.pLike" minOccurs="0" maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```xml
element prefixDef
{
  att.global.attributes,
  att.patternReplacement.attributes,
  attribute ident { text },
  model.pLike*
}
```

(text-profile description) provides a detailed description of non-bibliographic aspects of a text, specifically the languages and sublanguages used, the situation in which it was produced, the participants and their setting. [2.4. The Profile Description 2.1.1. The TEI Header and Its Components]
**<profileDesc>**

  - att.global.facs
    * @facs
- att.global.responsibility
  * @cert
  * @resp
- att.global.source
  * @source

**Contained by:** biblFull fileDesc

**May contain:**
- **core:** address date p pubPlace publisher ref
- **header:** availability distributor idno
- **linking:** ab

**Note**
Where a publication statement contains several members of the `model.publicationStmtPart.agency` or `model.publicationStmtPart.detail` classes rather than one or more paragraphs or anonymous blocks, care should be taken to ensure that the repeated elements are presented in a meaningful order. It is a conformance requirement that elements supplying information about publication place, address, identifier, availability, and date be given following the name of the publisher, distributor, or authority concerned, and preferably in that order.

**Example**

```xml
<publicationStmt>
  <publisher>C. Muquardt</publisher>
  <pubPlace>Bruxelles & Leipzig</pubPlace>
  <date when="1846"/>
</publicationStmt>
```

**Example**

```xml
<publicationStmt>
  <publisher>Chadwyck Healey</publisher>
  <pubPlace>Cambridge</pubPlace>
  <availability>
    <p>Available under licence only</p>
  </availability>
  <date when="1992">1992</date>
</publicationStmt>
```

**Example**

```xml
<publicationStmt>
  <publisher>Zea Books</publisher>
  <pubPlace>Lincoln, NE</pubPlace>
  <date>2017</date>
  <availability>
    <p>This is an open access work licensed under a Creative Commons Attribution 4.0 International license.</p>
  </availability>
  <ptr target="http://digitalcommons.unl.edu/zeabook/55"/>
</publicationStmt>
```

**Content model**

```xml
<content>
  <alternate>
    <sequence minOccurs="1" maxOccurs="unbounded">
      <classRef key="model.publicationStmtPart.agency"/>
    </sequence>
  </alternate>
</content>
```
<publisher>

(publisher) provides the name of the organization responsible for the publication or distribution of a bibliographic item. [3.12.2.4. Imprint, Size of a Document, and Reprint Information 2.2.4. Publication, Distribution, Licensing, etc.]

- att.cmc
  - @generatedBy

@type (type) may be used to indicate whether the offset passage is spoken or thought, or to characterize it more finely.

Status Optional

Datatype teidata.enumerated

Suggested values include: spoken (spoken) representation of speech

thought (thought) representation of thought, e.g. internal monologue

written (written) quotation from a written source

soCalled (so called) authorial distance

foreign (foreign) foreign words
**distinct** (distinct) linguistically distinct

**term** technical term

**emph** (emph) rhetorically emphasized

**mentioned** (mentioned) referring to itself, not its normal referent

character data

*Note* May be used to indicate that a passage is distinguished from the surrounding text for reasons concerning which no claim is made. When used in this manner, `<q>` may be thought of as syntactic sugar for `<hi>` with a value of `rend` that indicates the use of such mechanisms as quotation marks.

**Example**

It is spelled `<q>Tübingen</q>` — to enter the letter `<q>`>`u`>`</q>` with an umlaut hold down the `<q>`option`</q>` key and press `<q>`0 0 f c`</q>`

Member of model.biblPart

Contained by

- core: bibl
- header: notesStmt

May contain

- core: bibl/listBibl/ref
- header: biblFull

Note If the target attribute is used to reference the related bibliographic item, the element must be empty.

Example

```
<bibl xml:id="Shirley1953">
  <author>Shirley, James</author>
  <title type="main">The gentlemen of Venice</title>
  <pubPlace>New York</pubPlace>
  <publisher>Readex Microprint</publisher>
  <date>1953</date>
  <extent>1 microprint card, 23 x 15 cm.</extent>
  <relatedItem type="otherForm">
    <bibl>
      <author>Shirley, James</author>
      <title type="main">The gentlemen of Venice</title>
      <title type="sub">a tragi-comedie presented at the private house in Salisbury Court by Her Majesties servants</title>
      <pubPlace>London</pubPlace>
      <publisher>H. Moseley</publisher>
      <date>1655</date>
      <extent>78 p.</extent>
    </bibl>
  </relatedItem>
</bibl>
```

Example
Schematron: If the @target attribute on <sch:name/> is used, the relatedItem element must be empty. A relatedItem element should have either a @target attribute or a child element to indicate the related bibliographic item.

Content model:

```xml
<content>
  <alternate minOccurs="0" maxOccurs="1">
    <classRef key="model.biblLike"/>
    <classRef key="model.ptrLike"/>
  </alternate>
</content>
```

Schema Declaration:

```xml
element relatedItem
{
  att.global.attributes,
  att.typed.attributes,
  attribute target { text }?,
  ( model.biblLike | model.ptrLike )?
}
```

Processing Model:

```xml
<model behaviour="inline"/>
```

<rendition> (rendition) supplies information about the rendition or appearance of one or more elements in the source text. [2.3.4. The Tagging Declaration]
@cert
* @resp

- att.global.source
  * @source

- att.styleDef
  - @scheme
  - @schemeVersion

@scope where CSS is used, provides a way of defining pseudo-elements, that is, styling rules applicable to specific sub-portions of an element.

Status Optional

Datatype teidata.enumerated

Sample values include: first-line styling applies to the first line of the target element

  first-letter styling applies to the first letter of the target element

  before styling should be applied immediately before the content of the target element

  after styling should be applied immediately after the content of the target element

@selector contains a selector or series of selectors specifying the elements to which the contained style description applies, expressed in the language specified in the scheme attribute.

Status Optional

Datatype teidata.text

<rendition scheme="css"
  selector="text, front, back, body, div, p, ab">
  display: block;
</rendition>

<rendition scheme="css"
  selector="*[rend*=italic]"> font-style: italic;
</rendition>

Note Since the default value of the scheme attribute is assumed to be CSS, the default expectation for this attribute, in the absence of scheme, is that CSS selector syntax will be used.

While rendition is used to point from an element in the transcribed source to a <rendition> element in the header which describes how it appears, the selector attribute allows the encoder to point in the other direction: from a <rendition> in the header to a collection of elements which all share the same renditional features. In both cases, the intention is to record the appearance of the source text, not to prescribe any particular output rendering.
Example

```
<tagsDecl>
  <rendition xml:id="r-center" scheme="css">text-align: center;</rendition>
  <rendition xml:id="r-small" scheme="css">font-size: small;</rendition>
  <rendition xml:id="r-large" scheme="css">font-size: large;</rendition>
  <rendition xml:id="initcaps" scope="first-letter" scheme="css">font-size: xx-large</rendition>
</tagsDecl>
```

Content model

```
<content>
  <macroRef key="macro.limitedContent"/>
</content>
```

Schema Declaration

```
element rendition
{
  att.global.attributes,
  att.styleDef.attributes,
  attribute scope { text }?,
  attribute selector { text }?,
  macro.limitedContent
}
```

<resp> (responsibility) contains a phrase describing the nature of a person’s intellectual responsibility, or an organization’s role in the production or distribution of a work.

[3.12.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.2. The Edition Statement 2.2.5. The Series Statement]

figures: figure

header: idno

linking: anchor

tagdocs: code

transcr: fw subst

character data

Note The attribute ref, inherited from the class att.canonical may be used to indicate the kind of responsibility in a normalized form by referring directly to a standardized list of responsibility types, such as that maintained by a naming authority, for example the list maintained at http://www.loc.gov/marc/relators/relacode.html for bibliographic usage.

Example
<respStmt>
  <resp ref="http://id.loc.gov/vocabulary/relators/com.html">compiler</resp>
  <name>Edward Child</name>
</respStmt>

Content model

<content>
  <macroRef key="macro.phraseSeq.limited"/>
</content>

Schema Declaration

element resp
  {
    att.global.attributes,
    att.canonical.attributes,
    att.datable.attributes,
    attribute calendar { list { + } }?,
    macro.phraseSeq.limited
  }

<respStmt> (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work. [3.12.2.2. @label provides a label (usually a single letter) to identify which part of a rhyme scheme this rhyming string instantiates.

Status Recommended
Datatype `teidata.word`

Note Within a particular scope, all `<rhyme>` elements with the same value for their `label` attribute are assumed to rhyme with each other. The scope is defined by the nearest ancestor element for which the `rhyme` attribute has been supplied.

Note This element records all information about systematic inclusion or omission of portions of the text, whether a reflection of sampling procedures in the pure sense or of systematic omission of material deemed either too difficult to transcribe or not of sufficient interest.

Example

```xml
<samplingDecl>
  <p>Samples of up to 2000 words taken at random from the beginning, middle, or end of each text identified as relevant by respondents.</p>
</samplingDecl>
```

Content model

```xml
<content>
  <classRef key="model.pLike" minOccurs="1" maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```xml
element samplingDecl { att.global.attributes, model.pLike+ }
```

 arbitary segment) represents any segmentation of text below the chunk level.

character data

Note: The `<seg>` element may be used at the encoder’s discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a `<ptr>` or other similar element.

Example

```
<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>
```

Example

```
<s>
  <seg rend="caps" type="initial-cap">So father’s only</seg> glory was the ballfield.
</s>
```

Example

```
<seg type="preamble">
  <seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg>
  <seg>Sinfjotli was the eldest of his sons ...</seg>
  <seg>Borghild, Sigmund’s wife, had a brother ... </seg>
</seg>
```

Content model

**Processing Model**

```xml
<model behaviour="inline"
useSourceRendition="true"/>
```

**<seriesStmt>** (series statement) groups information about the series, if any, to which a publication belongs. [2.2.5. The Series Statement 2.2. The File Description]
Content model

```xml
<content>
  <alternate>
    <classRef key="model.pLike" minOccurs="1" maxOccurs="unbounded"/>
    <sequence>
      <elementRef key="title" minOccurs="1" maxOccurs="unbounded"/>
      <alternate minOccurs="0" maxOccurs="unbounded">
        <elementRef key="editor"/>
        <elementRef key="respStmt"/>
      </alternate>
      <alternate minOccurs="0" maxOccurs="unbounded">
        <elementRef key="idno"/>
        <elementRef key="biblScope"/>
      </alternate>
    </sequence>
  </alternate>
</content>
```

Schema Declaration

```xml
element seriesStmt
{
  att.global.attributes,
  ( model.pLike+ | ( title+, ( editor | respStmt )*, ( idno | biblScope )* ) )
}
```

(setting) contains a description of the setting, time, locale, appearance, etc., of the action of a play, typically found in the front matter of a printed performance text (not a stage direction). [7.1. Front and Back Matter]

drama: castList
figures: figure table
header: biblFull
linking: ab anchor
namesdates: listPerson listPlace
textstructure: floatingText
transcr: fw

Note Contains paragraphs or phrase level tags.

This element should not be used outside the front or back matter; for similar contextual descriptions within the body of the text, use the <stage> element.

Example

<set>
  <p>The action takes place on February 7th between the hours of noon and six in the afternoon, close to the Trenartha Tin Plate Works, on the borders of England and Wales, where a strike has been in progress throughout the winter.</p>
</set>

Example

<set>
  <head>SCENE</head>
  <p>A Sub-Post Office on a late autumn evening</p>
</set>

Example

<front>
  <!-- <titlePage>, <div type="Dedication">, etc. -->
  <set>
<settingDesc> (setting description) describes the setting or settings within which a language interaction takes place, or other places otherwise referred to in a text, edition, or metadata. [16.2. Contextual Information 2.4. The Profile Description]

    - att.global.analytic
Note: This element may be used to transcribe which character is speaking in a dramatic
text as indicated by the source text; the who attribute of an `<sp>` element may be
used to point to another element (typically a `<role>`) which provides information
about the character speaking. Either or both may be used.

Example

```html
<div type="Act" n="I">
  <head>ACT I</head>
  <div type="Scene" n="1">
    <head>SCENE I</head>
    <stage rendition="#italic">Enter Barnardo and Francisco, two Sentinels, at
    several doors</stage>
    <sp>
      <speaker>Barn</speaker>

@type indicates the kind of stage direction.

Status Recommended

Datatype 0–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: setting describes a setting.
  entrance describes an entrance.
  exit describes an exit.
  business describes stage business.
  novelistic is a narrative, motivating stage direction.
  delivery describes how a character speaks.
  modifier gives some detail about a character.
  location describes a location.
  mixed more than one of the above

Note If the value mixed is used, it must be the only value. Multiple
values may however be supplied if a single stage direction performs
multiple functions, for example is both an entrance and a modifier.

```

<surface> defines a written surface as a two-dimensional coordinate space, optionally
grouping one or more graphic representations of that space, zones of interest within
that space, and, when using an embedded transcription approach, transcriptions of
the writing within them. [12.1. Digital Facsimiles 12.2.2. Embedded Transcription]

Module transcr
Attributes
  • att.global
    – @xml:id
    – @n

      * @facs
    – att.global.responsibility
@attachment describes the method by which this surface is or was connected to the main surface.

**Status** Optional

**Datatype** teidata.enumerated

*Sample values include:* glued glued in place

pinned pinned or stapled in place

sewn sewn in place

@flipping indicates whether the surface is attached and folded in such a way as to provide two writing surfaces.

**Status** Optional

**Datatype** teidata.truthValue

The `<surface>` element represents any two-dimensional space on some physical surface forming part of the source material, such as a piece of paper, a face of a monument, a billboard, a scroll, a leaf etc.

The coordinate space defined by this element may be thought of as a grid \( lrx - ulx \) units wide and \( uly - lry \) units high.

The `<surface>` element may contain graphic representations or transcriptions of written zones, or both. The coordinate values used by every `<zone>` element contained by this element are to be understood with reference to the same grid.

Where it is useful or meaningful to do so, any grouping of multiple `<surface>` elements may be indicated using the `<surfaceGrp>` element.

**Example**

```xml
<facsimile>
  <surface ulx="0" uly="0" lrx="200" lry="300">
    ...
  </surface>
</facsimile>
```
Content model

**@rows** (rows) indicates the number of rows in the table.

- **Status** Optional
- **Datatype** [teidata.count]
- **Note** If no number is supplied, an application must calculate the number of rows.

Rows should be presented from top to bottom.

**@cols** (columns) indicates the number of columns in each row of the table.

- **Status** Optional
- **Datatype** [teidata.count]
- **Note** If no number is supplied, an application must calculate the number of columns.

Within each row, columns should be presented left to right.
Contains an optional heading and a series of rows.
Any rendition information should be supplied using the global \texttt{rend} attribute, at the table, row, or cell level as appropriate.

Example

```xml
<table rows="4" cols="4">
  <head>Poor Men's Lodgings in Norfolk (Mayhew, 1843)</head>
  <row role="label">
    <cell role="data">Dossing Cribs or Lodging Houses</cell>
    <cell role="data">Beds</cell>
    <cell role="data">Needys or Nightly Lodgers</cell>
  </row>
  <row role="data">
    <cell role="label">Bury St Edmund's</cell>
    <cell role="data">8</cell>
    <cell role="data">128</cell>
  </row>

* @ana
– att.global.facs
* @facs
– att.global.responsibility
* @cert
* @resp
– att.global.source
* @source

@g (generic identifier) specifies the name (generic identifier) of the element indicated by the tag, within the namespace indicated by the parent <namespace> element.

**Status**: Required  
**Datatype**: teidata.name

@occurs specifies the number of occurrences of this element within the text.

**Status**: Recommended  
**Datatype**: teidata.count

@withId (with unique identifier) specifies the number of occurrences of this element within the text which bear a distinct value for the global xml:id attribute.

**Status**: Recommended  
**Datatype**: teidata.count

**Contained by**: namespace

**May contain**:
- abbr
- address
- bibl
- choice
- cit
- date
- desc
- email
- expan
- foreign
- hi
- label
- list
- listBibl
- measure
- name
- num
- q
- quote
- ref
- rs
- stage
- term
- time
- title

**drama**: castList

**figures**: table

**header**: biblFull idno

**namesdates**: listPerson listPlace

**tagdocs**: code

**textstructure**: floatingText

**transcr**: subst

**character data**

**Example**

```xml
<tagsDecl partial="true">
  <rendition xml:id="it" scheme="css" selector="foreign, hi"> font-style: italic; </rendition>
  <!- - ... -->
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="28" withId="2"> Used to mark English words italicized in the copy text. </tagUsage>
    <tagUsage gi="foreign"> Used to mark non-English words in the copy text. </tagUsage>
  </namespace>
  <!- - ... -->
</tagsDecl>
```
Content model

```
<content>
  <macroRef key="macro.limitedContent"/>
</content>
```

Schema Declaration

```
element tagUsage
{
  att.global.attributes,
  attribute gi { text },
  attribute occurs { text }?,
  attribute withId { text }?,
  macro.limitedContent
}
```

<tagDecl> (tagging declaration) provides detailed information about the tagging applied to a document. [2.3.4. The Tagging Declaration]

**Module header**

**Attributes**

- `att.global`
  - `@xml:id`
  - `@n`
  - `@xml:lang`
  - `@xml:base`
  - `@xml:space`
  - `att.global.rendition` *
    - `@rendition`
  - `att.global.linking` *
    - `@corresp`
    - `@next`
    - `@prev`
  - `att.global.analytic` *
    - `@ana`
  - `att.global.facs` *
    - `@facs`
  - `att.global.responsibility` *
    - `@cert`
    - `@resp`
  - `att.global.source` *
    - `@source`

@partial indicates whether the element types listed exhaustively include all those found within `<text>`, or represent only a subset.

**Status** Recommended
Datatype: teidata.truthValue

Note: TEI recommended practice is to specify this attribute. When the `<tagUsage>` elements inside `<tagsDecl>` are used to list each of the element types in the associated `<text>`, the value should be given as false. When the `<tagUsage>` elements inside `<tagsDecl>` are used to provide usage information or default renditions for only a subset of the element types within the associated `<text>`, the value should be true.

Member of: model.encodingDescPart

Contained by:
header: encodingDesc

May contain:
header: namespace rendition

Example:

```xml
<tagsDecl partial="true">
  <rendition xml:id="rend-it" scheme="css">
    selector="emph, hi, name, title">font-style: italic;</n
  </rendition>
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="467"/>
    <tagUsage gi="title" occurs="45"/>
  </namespace>
  <namespace name="http://docbook.org/ns/docbook">
    <tagUsage gi="para" occurs="10"/>
  </namespace>
</tagsDecl>
```

If the partial attribute were not specified here, the implication would be that the document in question contains only `<hi>`, `<title>`, and `<para>` elements.

Content model:

```xml
<content>
  <sequence>
    <elementRef key="rendition" minOccurs="0" maxOccurs="unbounded"/>
    <elementRef key="namespace" minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
</content>
```

Schema Declaration:

```xml
element tagsDecl
{
  att.global.attributes,
  attribute partial { text }?,
  ( rendition*, namespace* )
}
```

<taxonomy> (taxonomy) defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy. [2.3.7. The Classification Declaration]

    * @ana
  - **att.global.facs**
    * @facs
  - att.global.responsibility
    * @cert
    * @resp
</teiCorpus>
```
@version (version) specifies the version number of the TEI Guidelines against which this document is valid.

*Status Optional

*Datatype teidata.version

*Note Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the source attribute on the associated <schemaSpec>.

*Member of model.describedResource

*Contained by core: teiCorpus

*May contain

*core: teiCorpus

*header: teiHeader

*textstructure: TEI text
transeit: facsimile

*Note Should contain one TEI header for the corpus, and a series of <TEI> elements, one for each text.

*Example

```xml
<teiCorpus version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <!-- header for corpus -->
  </teiHeader>
  <TEI>
    <teiHeader>
      <!-- header for first text -->
    </teiHeader>
    <text>
      <!-- content of first text -->
    </text>
  </TEI>
  <teiCorpus version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  </teiCorpus>
```

*Content model
Schema Declaration

```xml
<content>
<sequence>
  <elementRef key="teiHeader"/>
  <classRef key="model.resource"
    minOccurs="0" maxOccurs="unbounded"/>
  <classRef key="model.describedResource"
    minOccurs="1" maxOccurs="unbounded"/>
</sequence>
</content>
```

**<teiHeader>** (TEI header) supplies descriptive and declarative metadata associated with a digital resource or set of resources. [2.1.1. The TEI Header and Its Components](#)]

**Module** header

**Attributes**

- `att.global`
  - `@xml:id`
  - `@n`
  - `@xml:lang`
  - `@xml:base`
  - `@xml:space`
  - `att.global.rendition`  
    - `@rendition`
  - `att.global.linking`  
    - `@corresp`
    - `@next`
    - `@prev`
  - `att.global.analytic`  
    - `@ana`

Character data

Note This element should only be used in the TEI Header

Example

```xml
<keywords>
    <term>huntin</term>
    <term>shootin</term>
    <term>fishin</term>
</keywords>
```

Content model

```xml
<content>
    <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element term
{
    att.global.attributes,
    att.pointing.attributes,
    att.typed.attributes,
    att.canonical.attributes,
    att.sortable.attributes,
    att.cReferencing.attributes,
}
<text> (text) contains a single text of any kind, whether unitary or composite, for example a poem or drama, a collection of essays, a novel, a dictionary, or a corpus sample. [4. Default Text Structure] 16.1. Varieties of Composite Text

Contained by

core: teiCorpus
textstructure: TEI group

May contain

core: cb gap lb milestone note pb
figures: figure
linking: anchor
textstructure: back body front group
transcr: fw
Note This element should not be used to represent a text which is inserted at an arbitrary point within the structure of another, for example as in an embedded or quoted narrative; the `<floatingText>` is provided for this purpose.

Example

```
<text>
  <front>
    <docTitle>
      <titlePart>Autumn Haze</titlePart>
    </docTitle>
  </front>
  <body>
    <l>Is it a dragonfly or a maple leaf?</l>
    <l>That settles softly down upon the water?</l>
  </body>
</text>
```

Example The body of a text may be replaced by a group of nested texts, as in the following schematic:

```
<text>
  <front>
    <!-- front matter for the whole group -->
  </front>
  <group>
    <text>
      <!-- first text -->
    </text>
    <text>
      <!-- second text -->
    </text>
  </group>
</text>
```

Content model

```

    * @from
    * @to
• att.cmc
  - @generatedBy
• att.typed
  - @type
  - @subtype

@type classifies the title according to some convenient typology.
Derived from att.typed
Status Optional
Datatype: teidata.enumerated

Note: This attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single <title> element.

@calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs.

Deprecated will be removed on 2024-11-11

Status: Optional

Datatype: 1–∞ occurrences of teidata.pointer separated by whitespace

Schematron: <sch:rule context="tei:*[@calendar]">
  <sch:assert test="string-length(normalize-space(.)) gt 0">
    @calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert>
  </sch:rule>

@level indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

Status: Optional

Datatype: teidata.enumerated

Legal values are: a (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.

m (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works

j (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper

s (series) the title applies to a series of otherwise distinct publications such as a collection

u (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)

Note: The level of a title is sometimes implied by its context: for example, a title appearing directly within an <analytic> element is ipso facto of level a, and one appearing within a <series> element of level s. For this reason, the level attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.

character data

Note The attributes key and ref, inherited from the class att.canonical may be used to indicate the canonical form for the title; the former, by supplying (for example) the identifier of a record in some external library system; the latter by pointing to an XML element somewhere containing the canonical form of the title.

Example

Example

    <title>Hardy's Tess of the D'Urbervilles: a machine readable edition</title>

Example

    <title type="full">
    <title type="main">Synthèse</title>
    <title type="sub">an international journal for epistemology, methodology and history of science</title>
    </title>

  faded (faded)
background_noise (background noise)
eccentric_ductus (eccentric ductus) indicates illegibility due to an unusual, awkward, or incompetent execution of a glyph or glyphs
<div>
  <head>Rx</head>
  <p>500 mg <unclear reason="illegible">placebo</unclear></p>
</div>

Note One or more words may be used to describe the reason; usually each word will refer to a single cause.

@agent Where the difficulty in transcription arises from damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype teidata.enumerated

Sample values include: rubbing damage results from rubbing of the leaf edges

mildew damage results from mildew on the leaf surface

smoke damage results from smoke

character data

Note The same element is used for all cases of uncertainty in the transcription of element content, whether for written or spoken material. For other aspects of certainty,
uncertainty, and reliability of tagging and transcription, see chapter 22. Certainty, Precision, and Responsibility.

The `<damage>`, `<gap>`, `<del>`, `<unclear>` and `<supplied>` elements may be closely allied in use. See section 12.3.3. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The `hand` attribute points to a definition of the hand concerned, as further discussed in section 12.3.2.1. Document Hands.

Example

```xml
<u>...and then <unclear reason="background-noise">Nathalie</unclear> said ...
</u>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
element unclear
{
  att.global.attributes,
  att.editLike.attributes,
  att.dimensions.attributes,
  att.cmc.attributes,
  attribute reason
  {
  list
  {
    "illegible"
    "inaudible"
    "faded"
    "background_noise"
    "eccentric_ductus"
    }
  }?,
  attribute agent { text }?,
  macro.paraContent
}
```

Processing Model

```xml
<model behaviour="inline">
<outputRendition scope="after">content: '? [?] ';</outputRendition>
</model>
```

(unicode property) provides a Unicode property for a character (or glyph). [5.2.1. Character Properties]

Module gaiji

May contain ANY

Example This example presumes that the prefix dc has been bound to the namespace http://purl.org/dc/elements/1.1/ and the prefix rdf is bound to the namespace http://www.w3.org/1999/02/22-rdf-syntax-ns#. Note: The about attribute on the <rdf:Description> in this example gives a URI indicating the resource to which the metadata contained therein refer. The <rdf:Description> in the second <xenoData> block has a blank about, meaning it is pointing at the current document, so the RDF is about the document within which it is contained, i.e. the TEI document containing the <xenoData> block. Similarly, any kind of relative URI may be used, including fragment identifiers (see SG-id). Do note, however, that if the contents of the <xenoData> block are to be extracted and used elsewhere, any relative URIs will have to be resolved accordingly.

Example In this example, the prefix rdf is bound to the namespace http://www.w3.org/1999/02/22-rdf-syntax-ns#, the prefix dc is bound to the namespace http://purl.org/dc/elements/1.1/, and the prefix cc is bound to the namespace http://web.resource.org/cc/.
Example. In this example, the prefix dc is again bound to the namespace http://www.openarchives.org/OAI/2.0/oai_dc/, and the prefix oai_dc is bound to the namespace http://www.openarchives.org/OAI/2.0/oai_dc/.

Example. In this example, the prefix mods is bound to the namespace http://www.loc.gov/mods/v3.
Example This example shows GeoJSON embedded in <xenoData>. Note that JSON does not permit newlines inside string values. These must be escaped as \
. To avoid the accidental insertion of newlines by software, the use of xml:space is recommended. Blocks of JSON should be wrapped in CDATA sections, as they may contain characters illegal in XML.

```xml
<xenoData xml:space="preserve">
  <![CDATA[

Content model

```xml
<content>
  <alternate>
    <textNode/>
    <anyElement/>
  </alternate>
</content>
```

Schema Declaration

```xml
element xenoData
{
  att.global.attributes,
  att.typed.attributes,
  ( text | anyElement_xenoData_1 )
}
```

<zone> defines any two-dimensional area within a <surface> element. [12.1. Digital Facsimiles 12.2.2. Embedded Transcription]

**Module** transcr

**Attributes**

- att.global
  - @xml:id
  - @n
  - @xml:lang
  - @xml:base
  - @xml:space
  - att.global.rendition
    * @rendition
  - att.global.linking
    * @corresp
    * @next
    * @prev
  - att.global.analytic
    * @ana
  - att.global.facs
    * @facs
  - att.global.responsibility

408
@rotate indicates the amount by which this zone has been rotated clockwise, with respect to the normal orientation of the parent <surface> element as implied by the dimensions given in the <msDesc> element or by the coordinates of the <surface> itself. The orientation is expressed in arc degrees.

Status: Optional
Datatype: teidata.count
Default: 0

Member of: model.linePart
Contained by:
transcr: surface zone
May contain:
analysis: c pc w
core: add ch choice del gap graphic hi lb milestone note pb q unclear
figures: figure formula

gaiji: g
linking: anchor seg
transcr: fw surface zone

Note: The position of every zone for a given surface is always defined by reference to the coordinate system defined for that surface.

A graphic element contained by a zone represents the whole of the zone.
A zone may be of any shape. The attribute points may be used to define a polygonal zone, using the coordinate system defined by its parent surface.
A zone is always a closed polygon. Repeating the initial coordinate at the end of the sequence is optional. To encode an unclosed path, use the <path> element.

Example
This example defines a non-rectangular zone: see the illustration in section PH-surfzone.

Example

```
<facsimile>
  <surface ulx="50" uly="20" lrx="400" lry="280">
    <zone ulx="0" uly="0" lrx="500" lry="321">
      <graphic url="graphic.png"/>
    </zone>
  </surface>
</facsimile>
```

This example defines a zone which has been defined as larger than its parent surface in order to match the dimensions of the graphic it contains.

Content model

```

}
```

17.2 Model classes

model.addrPart groups elements such as names or postal codes which may appear as part of a postal address. [3.6.2. Addresses]
model.addressLike groups elements used to represent a postal or email address.

**Module** tei
**Used by** model.pPart.data
**Members** address email

model.attributable groups elements that contain a word or phrase that can be attributed to a source.

**Module** tei
**Used by** cit macro.phraseSeq model.inter sp
**Members** model.quoteLike cit quote floatingText

model.availabilityPart groups elements such as licences and paragraphs of text which may appear as part of an availability statement.

**Module** tei
**Used by** availability
**Members** licence

model.biblLike groups elements containing a bibliographic description.

**Module** tei
**Used by** cit listBibl model.inter model.personPart place relatedItem sourceDesc taxonomy
**Members** bibl biblFull listBibl

model.biblPart groups elements which represent components of a bibliographic description.

**Module** tei
**Used by** bibl
**Members** model.imprintPart biblScope distributor pubPlace publisher

model.castItemPart groups component elements of an entry in a cast list, such as dramatic role or actor’s name.

**Module** tei
**Used by** castItem
**Members** actor role roleDesc
**model.choicePart** groups elements (other than `<choice>` itself) which can be used within a `<choice>` alternation. [3.5. Simple Editorial Changes]

*Module* tei

*Used by* choice

*Members* abbr corr expan orig reg seg sic supplied unclear

---

**model.common** groups common chunk- and inter-level elements. [1.3. The TEI Class System]

</tbody>
</table>

Note: This class of elements can occur within paragraphs, list items, lines of verse, etc.
**model.placeLike** groups elements used to provide information about places and their relationships.

*Module* tei  
*Used by* listPlace, place, settingDesc  
*Members* place

**model.profileDescPart** groups elements which may be used inside `<profileDesc>` and appear multiple times.

*Module* tei  
*Used by* profileDesc  
*Members* abstract, creation, langUsage, particDesc, settingDesc, textClass

**model.ptrLike** groups elements used for purposes of location and reference. [3.7. Simple Links and Cross-References]

*Module* tei  
*Used by* bibl, cit, model.limitedPhrase, model.phrase, model.publicationStmtPart.detail, relatedItem  
*Members* ref

**model.publicationStmtPart.agency** groups the child elements of a `<publicationStmt>` element of the TEI header that indicate an authorising agent. [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei  
*Used by* publicationStmt  
*Members* distributor, publisher  
*Note* The agency child elements, while not required, are required if one of the detail child elements is to be used. It is not valid to have a detail child element without a preceding agency child element.  
See also `model.publicationStmtPart.detail`.

**model.publicationStmtPart.detail** groups the agency-specific child elements of the `<publicationStmt>` element of the TEI header. [2.2.4. Publication, Distribution, Licensing, etc.]

*Module* tei  
*Used by* publicationStmt  
*Members* model.ptrLike[ref], address, availability, date, idno, pubPlace  
*Note* A detail child element may not occur unless an agency child element precedes it.  
See also `model.publicationStmtPart.agency`.

**model.quoteLike** groups elements used to directly contain quotations.
**model.resource** groups separate elements which constitute the content of a digital resource, as opposed to its metadata. \[1.3. The TEI Class System\]

**Module** tei
**Used by** model.attributable
**Members** cit quote

**model.respLike** groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.

**Module** tei
**Used by** editionStmt model.biblPart titleStmt
**Members** author editor respStmt

**model.segLike** groups elements used for arbitrary segmentation. \[17.3. Blocks, Segments, and Anchors 18.1. Linguistic Segment Categories\]

**Module** tei
**Used by** bibl model.phrase
**Members** c pc s seg w

**Note** The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the `<segmentation>` element of the `<encodingDesc>` within the associated TEI header.

**model.stageLike** groups elements containing stage directions or similar things defined by the module for performance texts. \[7.3. Other Types of Performance Text\]

**Module** tei
**Used by** lg model.inter sp
**Members** stage

**Note** Stage directions are members of class `inter`: that is, they can appear between or within component-level elements.

**model.teiHeaderPart** groups high level elements which may appear more than once in a TEI header.

**Module** tei
**Used by** teiHeader
**Members** encodingDesc profileDesc xenoData

**model.titlepagePart** groups elements which can occur as direct constituents of a
title page, such as `<docTitle>`, `<docAuthor>`, `<docImprint>`, or `<epigraph>`. 

**Title Pages**

*Module* tei  
*Used by* `titlePage`  
*Members* `argument` `byline` `docAuthor` `docDate` `docEdition` `docImprint` `docTitle` `epigraph` `graphic` `imprimatur` `titlePart`

### 17.3 Attribute classes

**att.anchoring** (anchoring) provides attributes for use on annotations, e.g. notes and groups of notes describing the existence and position of an anchor for annotations.

*Module* tei  
*Members* `note`

**Attributes**

- `<@anchored>` (anchored) indicates whether the copy text shows the exact place of reference for the note.  
  *Status* Optional  
  *Datatype* `teidata.truthValue`  
  *Default* `true`

  **Note** In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. page 218, lines 3–4). The `anchored` attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value `true` indicates that such an explicit location is indicated in the copy text; the value `false` indicates that the copy text does not indicate a specific place of attachment for the note. If the specific symbols used in the copy text at the location the note is anchored are to be recorded, use the `n` attribute.

- `<@targetEnd>` (target end) points to the end of the span to which the note is attached, if the note is not embedded in the text at that point.  
  *Status* Optional  
  *Datatype* `1–∞` occurrences of `teidata.pointer` separated by whitespace

  **Note** This attribute is retained for backwards compatibility; it may be removed at a subsequent release of the Guidelines. The recommended way of pointing to a span of elements is by means of the `range` function of XPointer, as further described in [17.2.4.6.](#).

**Example**

```xml
<p>(...) tamen reuerendos dominos archiepiscopum et canonicos Leopolienses necnon episcopum in duplicibus Quatuortemperiodibus<anchor xml:id="A55234"/>
totaliter expediui...</p>
<!-- elsewhere in the document -->
<noteGrp targetEnd="#A55234">
  <note xml:lang="en"> Quatuor Tempora, so called dry fast days. </note>
  <note xml:lang="pl"> Quatuor Tempora, tzw. Suche dni postne. </note>
</noteGrp>
```
att.ascribed provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation | 8.3. Elements Unique to Spoken Texts]

Module tei
Members att.ascribed.directed | q | sp | stage | change

Attributes

- @who indicates the person, or group of people, to whom the element content is ascribed.
  Status Optional
  Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

In the following example from Hamlet, speeches (<sp>) in the body of the play are linked to <role> elements in the <castList> using the who attribute.

<castItem type="role">
  <role xml:id="Barnardo">Bernardo</role>
</castItem>
<castItem type="role">
  <role xml:id="Francisco">Francisco</role>
  <roleDesc>a soldier</roleDesc>
</castItem>

<!-- ... -->
<sp who="#Barnardo">
  <speaker>Bernardo</speaker>
  <l n="1">Who's there?</l>
</sp>
<sp who="#Francisco">
  <speaker>Francisco</speaker>
  <l n="2">Nay, answer me: stand, and unfold yourself.</l>
</sp>

Note For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified <person> element.

att.ascribed.directed provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. Quotation | 8.3. Elements Unique to Spoken Texts]

Module tei
Members q | sp | stage

Attributes

- att.ascribed

  - @who

  @toWhom indicates the person, or group of people, to whom a speech act or action is directed.
  Status Optional
  Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

In the following example from Mary Pix’s The False Friend, speeches (<sp>) in the body of the play are linked to <castItem> elements in the <castList> using the toWhom attribute, which is used to specify who the speech is directed to. Additionally, the <stage> includes toWhom to indicate the directionality of the action.

<castItem type="role">
  <role xml:id="emil">Emilius</role>
</castItem>
<castItem type="role">
  <role xml:id="emil">Emilius</role>
</castItem>
<role xml:id="lov">Lovisa</role>
</castItem>
<castItem type="role">
  <role xml:id="serv">A servant</role>
</castItem>

<!-- ... -->

<sp who="#emil" toWhom="#lov">
  <speaker>Emil.</speaker>
  <l n="1">My love!</l>
</sp>
<sp who="#lov" toWhom="#emil">
  <speaker>Lov.</speaker>
  <l n="2">I have no Witness of my Noble Birth</l>
</sp>
<stage who="emil" toWhom="#serv">Pointing to her Woman.</stage>
<l n="3">But that poor helpless wretch——</l>

Note To indicate the recipient of written correspondence, use the elements used in section 2.4.6. Correspondence Description, rather than a toWhom attribute.

---

**att.breaking** provides attributes to indicate whether or not the element concerned is considered to mark the end of an orthographic token in the same way as whitespace.

[3.11.3. Milestone Elements]

**Module** tei

**Members** cb lb milestone pb

**Attributes**

@break indicates whether or not the element bearing this attribute should be considered to mark the end of an orthographic token in the same way as whitespace.

**Status** Recommended

**Datatype** teidata.enumerated

**Sample values include**

- **yes** the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace
- **no** the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace
- **maybe** the encoding does not take any position on this issue.

In the following lines from the ‘Dream of the Rood’, linebreaks occur in the middle of the words lāðost and reord-berendum. <ab>
...eƿesa tome iu icpæs ʒeporden pita heardoft . leodum lālb break="no"/> ðost ærþan ichim lifes pæʒ rhtne ʒerymde reord be<lb break="no"/>
rendum hþmt me ʒastepeorðode puldres ealdor ofer...
</ab>

---

**att.cReferencing** provides attributes that may be used to supply a canonical reference as a means of identifying the target of a pointer.

**Module** tei
@cRef (canonical reference) specifies the destination of the pointer by supplying a canonical reference expressed using the scheme defined in a `<refsDecl>` element in the TEI header.

Status: Optional

Datatype: `teidata.text`

Note: The value of `cRef` should be constructed so that when the algorithm for the resolution of canonical references (described in section 17.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.

The `<refsDecl>` to use may be indicated with the `decls` attribute.

Currently these Guidelines only provide for a single canonical reference to be encoded on any given `<ptr>` element.

---

**att.calendarSystem** provides attributes for indicating calendar systems to which a date belongs. [3.6.4. Dates and Times] [14.4. Dates]

Module: tei

Members: `date` `docDate` `time`

Attributes:

@calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs.

Status: Optional

Datatype: 1–∞ occurrences of `teidata.pointer` separated by whitespace

Schematron: `<sch:rule context="tei:*[@calendar]">  
  <sch:assert test="string-length( normalize-space(.) ) gt 0">  
    @calendar indicates one or more systems or calendars to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert>  
  </sch:rule>`

He was born on `<date calendar="#gregorian">Feb. 22, 1732</date>` (<`date calendar="#julian" when="1732-02-22">Feb. 11, 1731/32, O.S.</date>`).

He was born on `<date calendar="#gregorian #julian" when="1732-02-22">Feb. 22, 1732 (Feb. 11, 1731/32, O.S.)</date>`.

Note: Note that the `calendar` attribute declares the calendar system used to interpret the textual content of an element, as it appears on an original source. It does not modify the interpretation of the normalization attributes provided by `att.datable.w3c`, `att.datable.iso`, or `att.datable.custom`. Attributes from those first two classes are always interpreted as Gregorian or proleptic Gregorian dates, as per the respective standards on which they are based. The calendar system used to interpret the last (`att.datable.custom`) may be specified with `datingMethod`.  

---

425
att.canonical provides attributes that can be used to associate a representation such as a name or title with canonical information about the object being named or referenced. [14.1.1. Linking Names and Their Referents]

Module tei

Members att.naming att.personal name author editor pubPlace rs actor catDesc date distributor docAuthor docTitle publisher resp respStmt term time title

Attributes

@ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Example In this contrived example, a canonical reference to the same organisation is provided in four different ways.

```xml
<a author n="1">
  <name ref="http://nztoc.victoria.ac.nz/tm/scholarly/name-427308.html" type="organisation">New Zealand Parliament, Legislative Council</name>
</a>

<a author n="2">
  <name ref="nzvn:427308" type="organisation">New Zealand Parliament, Legislative Council</name>
</a>

<a author n="3">
  <name ref="/named_entities.xml#o427308" type="organisation">New Zealand Parliament, Legislative Council</name>
</a>

<a author n="4">
  <name key="name-427308" type="organisation">New Zealand Parliament, Legislative Council</name>
</a>
```

The first presumes the availability of an internet connection and a processor that can resolve a URI (most can). The second requires, in addition, a <prefixDef> that declares how the nzvm prefix should be interpreted. The third does not require an internet connection, but does require that a file named named_entities.xml be in the same directory as the TEI document. The fourth requires that an entire external system for key resolution be available.

Note The key attribute is more flexible and general-purpose, but its use in interchange requires that documentation about how the key is to be resolved be sent to the recipient of the TEI document. In contrast values of the ref attribute are resolved using the widely accepted protocols for a URI, and thus less documentation, if any, is likely required by the recipient in data interchange.

These guidelines provide no semantic basis or suggested precedence when both key and ref are provided. For this reason simultaneous use of both is not recommended.
unless documentation explaining the use is provided, probably in an ODD customization, for interchange.

**att.citing** provides attributes for specifying the specific part of a bibliographic item being cited.

**Attributes**

- `@unit` identifies the unit of information conveyed by the element, e.g., columns, pages, volume, entry.
  - **Status**: Optional
  - **Datatype**: `teidata.enumerated`
  - **Suggested values include**:
    - `volume` (volume) the element contains a volume number.
    - `issue` the element contains an issue number, or volume and issue numbers.
    - `page` (page) the element contains a page number or page range.
    - `line` the element contains a line number or line range.
    - `chapter` (chapter) the element contains a chapter indication (number and/or title)
    - `part` the element identifies a part of a book or collection.
    - `column` the element identifies a column.
    - `entry` the element identifies an entry number or label in a list of entries.

- `@from` specifies the starting point of the range of units indicated by the `unit` attribute.
  - **Status**: Optional
  - **Datatype**: `teidata.word`

- `@to` specifies the end-point of the range of units indicated by the `unit` attribute.
  - **Status**: Optional
  - **Datatype**: `teidata.word`

**att.cmc** (computer-mediated communication) provides attributes categorizing how the element content was created in a CMC environment.

**Attributes**

- `@generatedBy` (generated by) categorizes how the content of an element was generated in a CMC environment.
  - **Status**: Optional
  - **Datatype**: `teidata.enumerated`
Schematron  

\[
<\text{sch:rule context="tei:*[@generatedBy]">}
<\text{sch:assert test="ancestor-or-self:tei:post">}
The @generatedBy attribute is for use within a \text{<post> element.}</\text{sch:assert}>
</\text{sch:rule}>

Suggested values include: human the content was naturally typed or spoken by a human user.

- **template** the content was generated after a human user activated a template for its insertion.
- **system** the content was generated by the system, i.e. the CMC environment.
- **bot** the content was generated by a bot, i.e. a non-human agent, typically one that is not part of the CMC environment itself.
- **unspecified** the content was generated by an unknown or unspecified process.

Automatic system message in chat: user moves on to another chatroom

\[
<\text{post type="event" generatedBy="system" who="#system" rend="color:blue">}

</p>
</post>
\]

An automatic signature of user including an automatic timestamp (Wikipedia discussion, anonymized). The specification of generatedBy at the inner element \text{<signed> is meant to override the specification at the outer element \text{<post>. This is generally possible when the outer generatedBy value is "human". \text{<post type="standard" generatedBy="human" indentLevel="2" synch="#t00394407" who="#W000005582">}
</text{signed generatedBy="template" rend="inline">
att.coordinated provides attributes that can be used to position their parent element within a two dimensional coordinate system.

**Module** transcr
**Members** surface zone
**Attributes**

- **@start** indicates the element within a transcription of the text containing at least the start of the writing represented by this zone or surface.
  - **Status** Optional
  - **Datatype** teidata.pointer
- **@ulx** gives the x coordinate value for the upper left corner of a rectangular space.
  - **Status** Optional
  - **Datatype** teidata.numeric
- **@uly** gives the y coordinate value for the upper left corner of a rectangular space.
  - **Status** Optional
  - **Datatype** teidata.numeric
- **@lrx** gives the x coordinate value for the lower right corner of a rectangular space.
  - **Status** Optional
  - **Datatype** teidata.numeric
- **@lry** gives the y coordinate value for the lower right corner of a rectangular space.
  - **Status** Optional
  - **Datatype** teidata.numeric
- **@points** identifies a two dimensional area by means of a series of pairs of numbers, each of which gives the x,y coordinates of a point on a line enclosing the area.
  - **Status** Optional
  - **Datatype** 3–∞ occurrences of teidata.point separated by whitespace

att.datable provides attributes for normalization of elements that contain dates, times, or datable events. [3.6.4. Dates and Times | 14.4. Dates]

**Module** tei
**Members** att.gaijiProp/localProp/unicodeProp/unihanProp author change creation date docDate editor idno licence mapping name resp time title
**Attributes**

- **att.datable.w3c**
@period supplies pointers to one or more definitions of named periods of time (typically <category>s, <date>s or <event>s) within which the datable item is understood to have occurred.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

This superclass provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.datable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.datable.iso and att.datable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

att.datable.w3c provides attributes for normalization of elements that contain datable events conforms to the W3C XML Schema Part 2: Datatypes Second Edition.

Module tei

Members att.datable att.gaijiProp localProp unicodeProp unihanProp author change creation date docDate editor idno licence mapping name resp time title

Attributes

@when supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

Examples of W3C date, time, and date & time formats. <p>
<date when="1945-10-24">24 Oct 45</date>
<date when="1996-09-24T07:25:00Z">September 24th, 1996 at 3:25 in the morning</date>
<time when="1999-01-04T20:42:00-05:00">Jan 4 1999 at 8 pm</time>
<time when="14:12:38">fourteen twelve and 38 seconds</time>
<date when="1962-10">October of 1962</date>
<date when="06-12">June 12th</date>
<date when="01">the first of the month</date>
<date when="08">August</date>
<date when="2006">MMVI</date>
<date when="0056">AD 56</date>
<date when="-0056">56 BC</date>
</p>

This list begins in the year 1632, more precisely on Trinity Sunday, i.e. the Sunday after Pentecost, in that year the <date calendar="#julian" when="1632-06-06">27th of May (old style)</date>.
<opener>
<dateline>
<placeName>Dorchester, Village,</placeName>
<date when="1828-03-02">March 2d. 1828.</date>
</dateline>
<salute>To
Mrs. Cornell,</salute> Sunday
<time when="12:00:00">noon.</time>
</opener>

@notBefore specifies the earliest possible date for the event in standard form, e.g.

```xml
<date notBefore="1828-03-01"/> March 1, 1828.
```

Status Optional

Datatype | teidata.temporal.w3c

@notAfter specifies the latest possible date for the event in standard form, e.g.

```xml
<date notAfter="1828-03-03"/> March 3, 1828.
```

Status Optional

Datatype | teidata.temporal.w3c

@from indicates the starting point of the period in standard form, e.g.

```xml
<date from="1863-05-28" to="1863-06-01">May 28 through June 1, 1863</date>
```

Status Optional

Datatype | teidata.temporal.w3c

@to indicates the ending point of the period in standard form, e.g. yyyy-mm-dd.

```xml
<date from="1863-05-28" to="1863-06-01">May 28 through June 1, 1863</date>
```

Status Optional

Datatype | teidata.temporal.w3c

Schematron: The @when attribute cannot be used with any other att.datatable.w3c attributes.

Schematron: The @from and @notBefore attributes cannot be used together.

Schematron: The @to and @notAfter attributes cannot be used together.

Example

```xml
<date from="1863-05-28" to="1863-06-01">May 28 through June 1, 1863</date>
```

Note The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar.

The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy, --mm, --dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.

Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.

---

att.dimensions provides attributes for describing the size of physical objects.

Module tei

Members add | date | del | gap | subst | supplied | time | unclear
Attributes

@unit names the unit used for the measurement

Status Optional

Datatype teidata.enumerated

Legal values are: chars characters

lines lines

pages pages

words words

cm centimetres

mm millimetre

in inches

@quantity specifies the length in the units specified

Status Optional

Datatype teidata.numeric

@extent indicates the size of the object concerned using a project-specific vocabulary combining quantity and units in a single string of words.

Status Optional

Datatype teidata.text

<gap extent="5 words"/>

<height extent="half the page"/>

@scope where the measurement summarizes more than one observation, specifies the applicability of this measurement.

Status Optional

Datatype teidata.enumerated

Sample values include: all measurement applies to all instances.

most measurement applies to most of the instances inspected.

range measurement applies to only the specified range of instances.

---

att.divLike provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]

Module tei

Members div lg

Attributes

• att.metrical

  – @rhyme

• att.fragmentable

  – @part

@org (organization) specifies how the content of the division is organized.

Status Optional

Datatype teidata.enumerated

Legal values are: composite no claim is made about the sequence in which the immediate contents of this division are to be processed, or their inter-relationships.

uniform the immediate contents of this element are regarded as forming a logical unit, to be processed in sequence.[Default]

@sample indicates whether this division is a sample of the original source and if so, from which part.
att.docStatus provides attributes for use on metadata elements describing the status of a document.

Module tei
Members bibl biblFull change revisionDesc
Attributes

@status describes the status of a document either currently or, when associated with a dated element, at the time indicated.

Status Optional
Datatype teidata.enumerated
Sample values include: approved
candidate
cleared
deprecated
draft [Default]
embargoed
expired
frozen
galley
proposed
published
recommendation
submitted
unfinished
withdrawn

Example

```xml
<revisionDesc status="published">
  <change when="2010-10-21" status="published"/>
  <change when="2010-10-02" status="cleared"/>
  <change when="2010-08-02" status="embargoed" who="#MSM"/>
  <change when="2010-05-01" status="frozen" who="#MSM"/>
  <change when="2010-03-01" status="draft" who="#LB"/>
</revisionDesc>
```
**att.editLike** provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [3.5. Simple Editorial Changes](#), [11.3. Origination](#) [14.3.2. The Person Element](#) [12.3.1.1. Core Elements for Transcriptional Work](#)

**Module** tei

**Members** att.transcriptional `add del subst corr date expan gap name person place reg supplied time unclear`

**Attributes**

*Note* The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.

Each pointer on the source (if present) corresponding to a witness or witness group should reference a bibliographic citation such as a `<witness>`, `<msDesc>`, or `<bibl>` element, or another external bibliographic citation, documenting the source concerned.

**att.edition** provides attributes identifying the source edition from which some encoded feature derives.

**Module** tei

**Members** `cb lb milestone pb`

**Attributes**

`@ed` (edition) supplies a sigil or other arbitrary identifier for the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.

*Status* Optional

*Datatype* 1–∞ occurrences of `teidata.word` separated by whitespace

`@edRef` (edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.

*Status* Optional

*Datatype* 1–∞ occurrences of `teidata.pointer` separated by whitespace

**Example**

```xml
Of Mans First Disobedience, <lb ed="1674"/> and <lb ed="1667"/> the Fruit</l>
Of that Forbidden Tree, whose <lb ed="1667 1674"/> mortal tast</l>
Brought Death into the World, <lb ed="1667"/> and all <lb ed="1674"/> our woe, </l>
```

**Example**

```xml
<bibl xml:id="stapledon1937">
<author>Olaf Stapledon</author>,
<title>Starmaker</title>, <publisher>Methuen</publisher>,
<date>1937</date>
</bibl>
<bibl xml:id="stapledon1968">
<author>Olaf Stapledon</author>,
<title>Starmaker</title>, <publisher>Dover</publisher>, <date>1968</date>
</bibl>
```
Looking into the future aeons from the supreme moment of the cosmos, I saw the populations still with all their strength maintaining the essentials of their ancient culture, still living their personal lives in zest and endless novelty of action. ... I saw myself still preserving, though with increasing difficulty, my lucid consciousness.

**att.fragmentable** provides attributes for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

**Module** tei

**Members** att.divLike div bg att.segLike c pc s eg w ab l p

**Attributes**

@part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.

**Status** Optional

**Datatype** teidata.enumerated

**Legal values are:**

- Y (yes) the element is fragmented in some (unspecified) respect
- N (no) the element is not fragmented, or no claim is made as to its completeness [Default]
- I (initial) this is the initial part of a fragmented element
- M (medial) this is a medial part of a fragmented element
- F (final) this is the final part of a fragmented element

**Note** The values I, M, or F should be used only where it is clear how the element may be reconstituted.

**att.gaijiProp** provides attributes for defining the properties of non-standard characters or glyphs.

**Module** gaiji

**Members** localProp unicodeProp unihanProp

**Attributes**

- @period
- @when
- @notBefore
- @notAfter
- @from
- @to

@name provides the name of the character or glyph property being defined.
Status Required

Datatype `teidata.xmlName`

@value provides the value of the character or glyph property being defined.

Status Required

Datatype `teidata.text`

@version specifies the version number of the Unicode Standard in which this property name is defined.

Status Optional

Datatype `teidata.enumerated`

Suggested values include: 1.0.1

1.1
2.0
2.1

12.1
13.0
14.0
15.0

unassigned

@scheme supplies the name of the character set system from which this property is drawn.

Status Optional

Datatype `teidata.enumerated`

Sample values include: Unicode (Unicode) ISO 10646[Default]

Bridwell (E. Nelson Bridwell) Original character set developed by E. Nelson Bridwell as described by Al Turniansky, in use from the 1950s to 1985.

Brewer (Georg Brewer) Developed by Georg Brewer, with a look
similar to the Byrne glyphs. Like the Byrne set, this is not a true character set, but rather a set of alternate glyphs.

**Doyle** (Darren Doyle) Glyph set (in some cases associated with multiple characters) developed by Darren Doyle as part of a comprehensive version of the language created in part for an invented language class at UT Austin in 2006.

**Schreyer** (Christine Schreyer) Character set (without actual codepoints) of 153 characters developed, along with pronunciation rules, roughly 300 words, and a grammar, developed by Christine Schreyer developed in 2012 for Warner Brothers.

**Example** In this example a definition for the Unicode property Decomposition Mapping is provided.

```xml
<unicodeProp name="Decomposition_Mapping" value="circle"/>
```

**Note** All name-only attributes need an xs:boolean attribute value inside `value`.

---

**att.global** provides attributes common to all elements in the TEI encoding scheme.

@xml:id (identifier) provides a unique identifier for the element bearing the attribute.

*Status* Optional

*Datatype* [ID]

*Note* The `xml:id` attribute may be used to specify a canonical reference for an element; see section 3.11. Reference Systems.

@n (number) gives a number (or other label) for an element, which is not necessarily unique within the document.

*Status* Optional

*Datatype* [teidata.text]

*Note* The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

@xml:lang (language) indicates the language of the element content using a tag generated according to BCP 47.

*Status* Optional

*Datatype* [teidata.language]

*Note* The `xml:lang` value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify `xml:lang` at the highest appropriate level, noticing that a different default may be needed for the `<teiHeader>` from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.

Only attributes with free text values (rare in these guidelines) will be in the scope of `xml:lang`.

The authoritative list of registered language subtags is maintained by IANA and is available at https://www.iana.org/assignments/language-subtag-registry. For a good general overview of the construction of language tags, see https://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php.

The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a `<language>` element with a matching value for its `ident` attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be
supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@xml:base provides a base URI reference with which applications can resolve relative URI references into absolute URI references.

**Status** Optional

**Datatype** teidata.pointer

```xml
<div type="bibl">
  <listBibl xml:base="https://romantic-circles.org/sites/default/files/imported/editions/southey_letters/XML/">
    <bibl>
      <ref target="letterEEd.26.3.xml">
        <title>Robert Southey to Grosvenor Charles Bedford</title>, <date when="1792-04-03">3 April 1792</date>.
      </ref>
    </bibl>
    <bibl>
      <ref target="letterEEd.26.57.xml">
        <title>Robert Southey to Anna Seward</title>, <date when="1793-09-18">18 September 1793</date>.
      </ref>
    </bibl>
    <bibl>
      <ref target="letterEEd.26.85.xml">
        <title>Robert Southey to Robert Lovell</title>, <date from="1794-04-05" to="1794-04-06">5-6 April, 1794</date>.
      </ref>
    </bibl>
  </listBibl>
</div>
```

@xml:space signals an intention about how white space should be managed by applications.

**Status** Optional

**Datatype** teidata.enumerated

*Legal values are:* default signals that the application’s default white-space processing modes are acceptable

preserve indicates the intent that applications preserve all white space

*Note* The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle xml:space correctly.

---

**att.global.analytic** provides additional global attributes for associating specific analyses or interpretations with appropriate portions of a text. [18.2. Global Attributes for Simple Analyses][18.2. Global Attributes for Simple Analyses] [18.3. Spans and Interpretations][18.3. Spans and Interpretations]

Attributes

@ana (analysis) indicates one or more elements containing interpretations of the element on which the ana attribute appears.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note When multiple values are given, they may reflect either multiple divergent interpretations of an ambiguous text, or multiple mutually consistent interpretations of the same passage in different contexts.

att.global.facs provides attributes used to express correspondence between an element and all or part of a facsimile image or surface. [12.1. Digital Facsimiles]

Module transcr

Members att.global[TEI] ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList castDesc catRef category cb cell change char charDecl choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText foreign formula front fw g gap glyph graphic group head hi idno imprimatur item keywords label langUsage language lb lg licence list listBibl listChange listPerson listPlace listPrefixDef localProp mapping measure milestone name namespace note notesStmt num opener orig p particDesc pb pc pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs s salute samplingDecl seg seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear unicodeProp unihanProp w xenoData zone

Attributes

@facsimile (facsimile) points to one or more images, portions of an image, or surfaces which correspond to the current element.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace
att.global/linking provides a set of attributes for hypertextual linking. [17. Linking, Segmentation, and Alignment]

Module linking

Members att.global TEl ab abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDec choice cit classCode classDecl closer code core creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatedText foreign formula front fg gap glyph graphic group head hi idno imprimatur item keywords label langUsage language lb lg licence list listBibl listChange listPerson listPlace listPrefixDef localProp mapping measure milestone name namespace note notesStmt num opener orig p particDesc pb pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher q quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs s salute samplingDecl seg seriesStmt set settingDesc sig signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear unicodedProp unihanProp w xenoData zone

Attributes

@corresp (corresponds) points to elements that correspond to the current element in some way.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

<group>
  <text xml:id="t1-g1-t1"
       xml:lang="mi">
    <body xml:id="t1-g1-t1-body1">
      <div type="chapter">
        <head>He Whakamaramatanga mo te Ture Hoko, Riihi hoki, i nga Whenua Maori, 1876.</head>
        <p>…</p>
      </div>
    </body>
  </text>
</group>

<group>
  <text xml:id="t1-g1-t2"
       xml:lang="en">
    <body xml:id="t1-g1-t2-body1"
         corresp="#t1-g1-t1-body1">
      <div type="chapter">
        <head>An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.</head>
        <p>…</p>
      </div>
    </body>
  </text>
</group>

In this example a <group> contains two <text>s, each containing the same document in a different language. The correspondence is indicated using corresp. The language is indicated using xml:lang, whose value is inherited; both the tag with the corresp and the tag pointed to by the corresp inherit the value from their immediate parent.

<!-- In a placeography called "places.xml" -->
<place xml:id="LOND1"
       corresp="people.xml#LOND2 people.xml#GENI1">
  <placeName>London</placeName>
</place>

441
<desc>The city of London...</desc>
</place>
<!-- In a literary personography called "people.xml" -->
<person xml:id="LOND2"
corresp="places.xml#LOND1 #GENI1">
<persName type="lit">London</persName>
</person>
<p note>
 Аллегорический характер представляющий город Лондон.
</p>
<person xml:id="GENI1"
corresp="places.xml#LOND1 #LOND2">
<persName type="lit">London’s Genius</persName>
</person>
<p note>
 Персонификация Лондонского таланта. Появляется как аллегорический
 характер в мэриатальных шоу.
</p>

In this example, an <place> element containing information about the city of London is linked with two <person> elements in a literary personography. This correspondence represents a slightly looser relationship than the one in the preceding example; there is no sense in which an allegorical character could be substituted for the physical city, or vice versa, but there is obviously a correspondence between them.

@next points to the next element of a virtual aggregate of which the current element is part.
Status Optional
Datatype teidata.pointer
Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

@prev (previous) points to the previous element of a virtual aggregate of which the current element is part.
Status Optional
Datatype teidata.pointer
Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.1.3. Rendition Indicators]

Module tei
Members att.global
        TEI ab br abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl choice cit classCode classDecl closer code cori creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText foreign formula front fw g gap glyph graphic group head hi idno imprimatur item keywords label langUsage language lb lg licence list listBibl listChange listPerson listPlace listPrefixDef localProp mapping measure milestone name namespace note notesStmt num opener prig p particDesc pb pc person place
att.global.rendition

Attributes

@rendition points to a description of the rendering or presentation used for this element in the source text.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Suggested values include: simple:allcaps all capitals

- simple:blackletter black letter or gothic typeface
- simple:bold bold typeface
- simple:bottombraced marked with a brace under the bottom of the text
- simple:boxed border around the text
- simple:centre centred
- simple:cursive cursive typeface
- simple:display block display
- simple:doublestrikethrough strikethrough with double line
- simple:doubleunderline underlined with double line
- simple:dropcap initial letter larger or decorated
- simple:float floated out of main flow
- simple:hyphen with a hyphen here (eg in line break)
- simple:inline inline rendering
- simple:justify justified text
- simple:italic italic typeface
- simple:larger larger type
- simple:left aligned to the left or left-justified
- simple:leftbraced marked with a brace on the left side of the text
- simple:letterspace larger-than-normal spacing between letters, usually for emphasis
- simple:literal fixed-width typeface, spacing preserved
- simple:normalstyle upright shape and default weight of typeface
- simple:normalweight normal typeface weight
- simple:right aligned to the right or right-justified
- simple:rightbraced marked with a brace to the right of the text
- simple:rotateleft rotated to the left
- simple:rotateright rotated to the right
- simple:smallcaps small caps
- simple:smaller smaller type
- simple:strike through
- simple:subscript subscript
- simple:superscript superscript
- simple:topbraced marked with a brace above the text
simple:typewriter  fixed-width typeface, like typewriter
simple:underline  underlined with single line
simple:wavyunderline underlined with wavy line

<head rendition="#ac #sc">
  <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On Her <lb/>
  <hi rendition="#normal">New Blazing-World</hi>.
</head>
<!... elsewhere... -->

Note  The rendition attribute is used in a very similar way to the class attribute defined for XHTML but with the important distinction that its function is to describe the appearance of the source text, not necessarily to determine how that text should be presented on screen or paper.

If rendition is used to refer to a style definition in a formal language like CSS, it is recommended that it not be used in conjunction with rend.  Where both rendition and rend are supplied, the latter is understood to override or complement the former.

Each URI provided should indicate a <rendition> element defining the intended rendition in terms of some appropriate style language, as indicated by the scheme attribute.

Schematron  <sch:rule context="tei:*[@rendition]"> <sch:let name="results" value="for $val in tokenize(normalize-space(@rendition),’\s+’) return starts-with($val,’simple:’) or (starts-with($val,’#’) and //tei:rendition[@xml:id=substring($val,2)])"/> <sch:assert test="every $x in $results satisfies $x"> Error: Each of the rendition values in "<sch:value-of select="@rendition"/>" must point to a local ID or to a token in the Simple scheme (<sch:value-of select="$results"/>)/</sch:assert> </sch:rule>

Schematron  <sch:rule context="tei:*[@corresp]"> <sch:let name="results" value="for $t in tokenize(normalize-space(@corresp),’\s+’) return starts-with($t,’#’) and not(id(substring($t,2)))"/> <sch:report test="some $x in $results satisfies $x"> Error: Every local pointer in "<sch:value-of select="@corresp"/>" must point to an ID in this document (<sch:value-of select="$results"/>)</sch:report> </sch:rule>

att.global.responsibility  provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the degree of certainty associated with it.  \[1.3.1.1.4. Sources, certainty, and responsibility\]

3.5. Simple Editorial Changes \[12.3.2.2. Hand, Responsibility, and Certainty Attributes\]

18.3. Spans and Interpretations \[14.1.1. Linking Names and Their Referents\]

Module  tei

Members  att.global TEI ab abbr abstract actor add addrLine address anchor argument author availability back bib bibFull biblScope body byline castGroup castItem castList catDesc catRef category cb cell change char charDec choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor
Attributes

@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.

*Status* Optional

*Datatype* teidata.probCert

@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.

*Status* Optional

*Datatype* 1–∞ occurrences of teidata.pointer separated by whitespace

*Note* To reduce the ambiguity of a *resp* pointing directly to a person or organization, we recommend that *resp* be used to point not to an agent (<person> or <org>) but to a <respStmt>, <author>, <editor> or similar element which clarifies the exact role played by the agent. Pointing to multiple <respStmt>s allows the encoder to specify clearly each of the roles played in part of a TEI file (creating, transcribing, encoding, editing, proofing etc.).

*Example*

**Blessed are the**

<pre>
<choice>
  <sic>cheesemakers</sic>
  <corr resp="#editor" cert="high">peacemakers</corr>
</choice>: for they shall be called the children of God.
</pre>

*Example*

```xml
<!-- in the <text> ... -->
<lg>
  <l>Punkes, Panders, bafe extortionizing sla</l>
  <sic>es</sic>
  <corr resp="#JENS1_transcriber">u</corr>
</choice>
</lg>

<!-- in the <teiHeader> ... -->
<resp_stmt xml:id="JENS1_transcriber">
  <resp when="2014">Transcriber</resp>
  <name>Janelle Jenstad</name>
</resp_stmt>
```
**att.global.source** provides attributes used by elements to point to an external source.

<table>
<thead>
<tr>
<th>Module</th>
<th>tei</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Members</strong></td>
<td>att.global, TEI abbr abstract actor add addrLine address anchor argument author availability back bibl biblFull biblScope body byline c castGroup castItem castList catDesc catRef category cb cell change char charDecl choice cit classCode classDecl closer code corr creation date dateline del desc distributor div docAuthor docDate docEdition docImprint docTitle edition editionStmt editor editorialDecl email encodingDesc epigraph expand extent facsimile figDesc figure fileDesc floatingText foreign formula front fw gap glyph graphic group head hi idno imprimatur item keywords label langUsage language li lg licence list listBibl listChange listPerson listPlace listPrefixDef localProp mapping measure milestone name namespace note notesStmt num opener orig p particDesc ph pc person place postscript prefixDef profileDesc projectDesc pubPlace publicationStmt publisher quote ref refsDecl reg relatedItem rendition resp respStmt revisionDesc rhyme role roleDesc row rs s salute samplingDecl seq seriesStmt set settingDesc sic signed sourceDesc sp speaker stage subst supplied surface table tagUsage tagsDecl taxonomy teiCorpus teiHeader term text textClass time title titlePage titlePart titleStmt trailer unclear unicodeProp unihanProp w xenoData zone</td>
</tr>
</tbody>
</table>

**Attributes**

@source specifies the source from which some aspect of this element is drawn.

**Status** Optional

**Datatype** 1–∞ occurrences of teidata.pointer separated by whitespace

**Schematron**

```xml
<sch:rule context="tei:*[@source]">
  <sch:let name="srcs" value="tokenize(normalize-space(@source),'.')"/>
  <sch:report test="(self::tei:classRef | self::tei:dataRef | self::tei:elementRef | self::tei:macroRef | self::tei:moduleRef | self::tei:schemaSpec ) and $srcs[2]"> When used on a schema description element (like <sch:value-of select="name(.)"/>, the @source attribute should have only 1 value. (This one has <sch:value-of select="count($srcs)"/>) </sch:report>
</sch:rule>
```

**Note** The source attribute points to an external source. When used on an element describing a schema component (<classRef>, <dataRef>, <elementRef>, <macroRef>, <moduleRef>, or <schemaSpec>), it identifies the source from which declarations for the components should be obtained.

On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.

In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, a private scheme URI of the form tei:x.y.z, where x.y.z indicates the version number, e.g. tei:4.3.2 for TEI P5 release 4.3.2 or (as a special case) tei:current for whatever is the latest release, or a private scheme URI that is expanded to an absolute URI as documented in a <prefixDef>.

When used on elements describing schema components, source
should have only one value; when used on other elements multiple values are permitted.

**Example**

```xml
<p>
<!-- ... -->
As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quote source="#mcc_2012">'Collaboration' is a problematic and should be a contested term.</quote>
<!-- ... -->
</p>
```

**Example**

```xml
<p>
<!-- ... -->
<quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote>
<!-- ... -->
</p>
<p>
<!-- ... -->
<bibl xml:id="chicago_15_ed">
</bibl>
```

**Example**

```xml
<elementRef key="p" source="tei:2.0.1"/>
```

Include in the schema an element named `<p>` available from the TEI P5 2.0.1 release.

**Example**

```xml
<schemaSpec ident="myODD"
source="mycompiledODD.xml">
<!-- further declarations specifying the components required -->
</schemaSpec>
```

Create a schema using components taken from the file mycompiledODD.xml.

**att.internetMedia** provides attributes for specifying the type of a computer resource using a standard taxonomy.

**Module** tei

**Members** att.media[graphic] ref

**Attributes**

- **@mimeType** (MIME media type) specifies the applicable multimedia internet mail extension (MIME) media type
  - **Status** Optional
  - **Datatype** `1–∞ occurrences of teidata.word` separated by whitespace

**Example** In this example `mimeType` is used to indicate that the URL points to a TEI XML file encoded in UTF-8.
Note This attribute class provides an attribute for describing a computer resource, typically available over the internet, using a value taken from a standard taxonomy. At present only a single taxonomy is supported, the Multipurpose Internet Mail Extensions (MIME) Media Type system. This typology of media types is defined by the Internet Engineering Task Force in RFC 2046. The list of types is maintained by the Internet Assigned Numbers Authority (IANA). The `mimeType` attribute must have a value taken from this list.

**att.linguistic** provides a set of attributes concerning linguistic features of tokens, for usage within token-level elements, specifically `<w>` and `<pc>` in the analysis module. [18.4.2. Lightweight Linguistic Annotation]

Module analysis

Members `<w>` `<pc>`

Attributes

- @lemma provides a lemma (base form) for the word, typically uninflected and serving both as an identifier (e.g. in dictionary contexts, as a headword), and as a basis for potential inflections.
  
  Status Optional
  
  Datatype `teidata.text`

  `<w lemma="wife">wives</w>`
  `<w lemma="Arznei">Artzeneyen</w>`

- @lemmaRef provides a pointer to a definition of the lemma for the word, for example in an online lexicon.
  
  Status Optional
  
  Datatype `teidata.pointer`

  `<w type="verb" lemma="hit" lemmaRef="http://www.example.com/lexicon/hitvb.xml">hitt<em type="suffix">ing</em></w>`

These attributes make it possible to encode simple language corpora and to add a layer of linguistic information to any tokenized resource. See section [18.4.2. Lightweight Linguistic Annotation] for discussion.

**att.measurement** provides attributes to represent a regularized or normalized measurement.

Module `tei`

Members `<measure>`

Attributes

- @unit (unit) indicates the units used for the measurement, usually using the standard symbol for the desired units.
  
  Status Optional
  
  Datatype `teidata.enumerated`

  Suggested values include: **m** (metre) SI base unit of length
  **kg** (kilogram) SI base unit of mass
s (second) SI base unit of time
Hz (hertz) SI unit of frequency
Pa (pascal) SI unit of pressure or stress
Ω (ohm) SI unit of electric resistance
L (litre) 1 dm³
t (tonne) 10³ kg
ha (hectare) 1 hm²
Å (ångström) 10⁻¹ m
mL (millilitre)
cm (centimetre)
dB (decibel) see remarks, below
kbit (kilobit) 10³ or 1000 bits
Kibit (kibibit) 2¹ or 1024 bits
kB (kilobyte) 10³ or 1000 bytes
KiB (kibibyte) 2¹ or 1024 bytes
MB (megabyte) 10⁶ or 1 000 000 bytes
MiB (mebibyte) 2² or 1 048 576 bytes

Note If the measurement being represented is not expressed in a particular unit, but rather is a number of discrete items, the unit count should be used, or the unit attribute may be left unspecified. Wherever appropriate, a recognized SI unit name should be used (see further http://www.bipm.org/en/publications/si-brochure/; http://physics.nist.gov/cuu/Units/). The list above is indicative rather than exhaustive.

@unitRef points to a unique identifier stored in the xml:id of a <unitDef> element that defines a unit of measure.
Status Optional
Datatype [teidata.pointer]

@quantity (quantity) specifies the number of the specified units that comprise the measurement
Status Optional
Datatype [teidata.numeric]

@commodity (commodity) indicates the substance that is being measured
Status Optional
Datatype 1–∞ occurrences of [teidata.word] separated by whitespace
Note In general, when the commodity is made of discrete entities, the plural form should be used, even when the measurement is of only one of them.

Schematron <sch:rule context="tei:*[@unitRef]">
<sch:report test=""@unit" role="info">The @unit attribute may be unnecessary when @unitRef is present.</sch:report>
</sch:rule>

Note This attribute class provides a triplet of attributes that may be used either to regularize the values of the measurement being encoded, or to normalize them with respect to a standard measurement system.
So weren't you gonna buy <measure quantity="0.5" unit="gal" commodity="ice cream">half a gallon</measure>, baby? <l>
So won't you go and buy <measure quantity="1.893" unit="L" commodity="ice cream">half a gallon</measure>, baby?</l>

The unit should normally be named using the standard symbol for an SI unit (see further http://www.bipm.org/en/publications/si-brochure/; http://physics.nist.gov/cuu/Units/). However, encoders may also specify measurements using informally defined units such as lines or characters.

**att.media** provides attributes for specifying display and related properties of external media.

*Module* tei

*Members* graphic

*Attributes*

- **@mimeTy**pe
  - **@width** Where the media are displayed, indicates the display width
  - **Status** Optional
  - **Datatype** teidata.outputMeasurement
- **@height** Where the media are displayed, indicates the display height
  - **Status** Optional
  - **Datatype** teidata.outputMeasurement
- **@scale** Where the media are displayed, indicates a scale factor to be applied when generating the desired display size
  - **Status** Optional
  - **Datatype** teidata.numeric

**att.metrical** defines a set of attributes that certain elements may use to represent metrical information. [6.4. Rhyme and Metrical Analysis]

*Module* verse

*Members* att.divLike[div lg] att.segLike[c pc s seg w l]

*Attributes*

- **@rhyme** (rhyme scheme) specifies the rhyme scheme applicable to a group of verse lines.
  - **Status** Recommended
  - **Datatype** token

*Note* By default, the rhyme scheme is expressed as a string of alphabetic characters each corresponding with a rhyming line. Any non-rhyming lines should be represented by a hyphen or an X. Alternative notations may be defined as for *met* by use of the `<metDecl>` element in the TEI header.

When the default notation is used, it does not make sense to specify this attribute on any unit smaller than a line. Nor does the default notation provide any way to record internal rhyme, or to specify
non-conventional rhyming practice. These extensions would require user-defined alternative notations.

**att.milestoneUnit** provides attributes to indicate the type of section which is changing at a specific milestone. [3.11.3. Milestone Elements](#) [2.3.6.3. Milestone](#) [Method](#) [2.3.6. The Reference System Declaration](#)

**Module** core

**Members** milestone

**Attributes**

@unit provides a conventional name for the kind of section changing at this milestone.

**Status** Required

**Datatype** teidata.enumerated

*Suggested values include:* page physical page breaks (synonymous with the `<pb>` element).

column column breaks.

date line breaks (synonymous with the `<lb>` element).

datebook any units termed book, liber, etc.

datepoem individual poems in a collection.

cantocanto cantos or other major sections of a poem.

datespeaker changes of speaker or narrator.

datestanza stanzas within a poem, book, or canto.

datescene acts within a play.

datesecond scenes within a play or act.

datesection sections of any kind.

dateabsent passages not present in the reference edition.

dateunnumbered passages present in the text, but not to be included as part of the reference.

```
<milestone n="23" ed="La" unit="Dreissiger"/>
... <milestone n="24" ed="AV" unit="verse"/> ...
```

**Note** If the milestone marks the beginning of a piece of text not present in the reference edition, the special value absent may be used as the value of unit. The normal interpretation is that the reference edition does not contain the text which follows, until the next `<milestone>` tag for the edition in question is encountered.

In addition to the values suggested, other terms may be appropriate (e.g. Stephanus for the Stephanus numbers in Plato).

The type attribute may be used to characterize the unit boundary in any respect other than simply identifying the type of unit, for example as word-breaking or not.

**att.naming** provides attributes common to elements which refer to named persons, places, organizations etc. [3.6.1. Referring Strings](#) [14.3.7. Names and Nyms](#)
Module tei
Members att.personal\[name\] author editor pubPlace rs
Attributes • att.canonical

@role may be used to specify further information about the entity referenced by this name in the form of a set of whitespace-separated values, for example the occupation of a person, or the status of a place.
Status Optional
Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

@nymRef (reference to the canonical name) provides a means of locating the canonical form (nym) of the names associated with the object named by the element bearing it.
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace
Note The value must point directly to one or more XML elements by means of one or more URIs, separated by whitespace. If more than one is supplied, the implication is that the name is associated with several distinct canonical names.

att.notated provides attributes to indicate any specialised notation used for element content.
Module tei
Members c formula quote s seg w
Attributes
@notation names the notation used for the content of the element.
Status Optional
Datatype teidata.enumerated

att.patternReplacement provides attributes for regular-expression matching and replacement. [17.2.3. Using Abbreviated Pointers] [2.3.6.3. Milestone Method] [2.3.6.2. Search-and-Replace Method]
Module header
Members prefixDef
Attributes
@matchPattern specifies a regular expression against which the values of other attributes can be matched.
Status Required
Datatype teidata.pattern
Note The syntax used should follow that defined by W3C XPath syntax. Note that parenthesized groups are used not only for establishing order of precedence and atoms for quantification, but also for creating subpatterns to be referenced by the replacementPattern attribute.
@replacementPattern specifies a replacement pattern, that is, the skeleton of a relative or absolute URI containing references to groups in the matchPattern which, once subpattern substitution has been performed, complete the URI.

Status Required
Datatype teidata.replacement

Note The strings $1, $2 etc. are references to the corresponding group in the regular expression specified by matchPattern (counting open parenthesis, left to right). Processors are expected to replace them with whatever matched the corresponding group in the regular expression.

If a digit preceded by a dollar sign is needed in the actual replacement pattern (as opposed to being used as a back reference), the dollar sign must be written as %24.

att.personal (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [14.2.1. Personal Names]

Module tei
Members name
Attributes
- att.naming
  - @role
  - @nymRef
  - att.canonical
    * @ref

@full indicates whether the name component is given in full, as an abbreviation or simply as an initial.
Status Optional
Datatype teidata.enumerated
Legal values are: yes (yes) the name component is spelled out in full.[Default] abb (abbreviated) the name component is given in an abbreviated form.
init (initial letter) the name component is indicated only by one initial.

@sort (sort) specifies the sort order of the name component in relation to others within the name.
Status Optional
Datatype teidata.count

att.placement provides attributes for describing where on the source page or object a textual element appears. 3.5.3. Additions, Deletions, and Omissions 12.3.1.4. Additions and Deletions

Module tei
Members add figure fw head label note stage trailer
Attributes
@place specifies where this item is placed.

Status Recommended

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Legal values are: above above the line
below below the line
top at the top of the page
top-right at the top right of the page
top-left at the top left of the page
top-centre at the top center of the page
bottom-right at the bottom right of the page
bottom-left at the bottom left of the page
bottom-centre at the bottom centre of the page
bottom at the foot of the page	

margin-right in the right-hand margin
margin in the outer margin
margin-inner in the inner margin
margin-left in the left-hand margin

opposite on the opposite, i.e. facing, page.
overleaf on the other side of the leaf.
overstrike superimposed on top of the current context
end at the end of the volume.
divend at the end the current division.
parend at the end the current paragraph.
inline within the body of the text.
inspace in a predefined space, for example left by an earlier scribe.

block formatted as an indented paragraph

<add place="margin">[An addition written in the margin]</add>
<add place="bottom opposite">[An addition written at the foot of the current page and also on the facing page]</add>
<note place="bottom">Ibid, p.7</note>

att.pointing provides a set of attributes used by all elements which point to other elements by means of one or more URI references. [1.3.1.1.2. Language Indicators 3.7. Simple Links and Cross-References]

Module tei

Members catRef licence note ref term

Attributes

@targetLang specifies the language of the content to be found at the destination referenced by target, using a language tag generated according to BCP 47.

Status Optional

Datatype teidata.language

Schematron

<sch:rule context="tei:*[not(self::tei:schemaSpec)][@targetLang]">
In the example above, the `<linkGrp>` combines pointers at parallel fragments of the *Universal Declaration of Human Rights*: one of them is in Polish, the other in Swahili.

**Note** The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a `<language>` element with a matching value for its `ident` attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@target specifies the destination of the reference by supplying one or more URI References

**Status** Optional

**Datatype** `1–∞ occurrences of teidata.pointer` separated by whitespace

**Schematron** `<sch:rule context="tei::*[@target]">`<br>`<sch:let name="results" value="for $t in tokenize(normalize-space(@target), '\s+') return starts-with($t,"#") and not(id(substring($t,2)))"/>` `<sch:report test="some $x in $results satisfies $x"> Error: Every local pointer in "<sch:value-of select="@target"/>" must point to an ID in this document (<sch:value-of select="$results"/>)/</sch:report>`<br>`</sch:rule>`

**Note** One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium.

@evaluate (evaluate) specifies the intended meaning when the target of a pointer is itself a pointer.

**Status** Optional

**Datatype** `teidata.enumerated`

**Legal values are:**

- **all** if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.

- **one** if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.

- **none** no further evaluation of targets is carried out beyond that needed to find the element specified in the pointer’s target.

**Note** If no value is given, the application program is responsible for
deciding (possibly on the basis of user input) how far to trace a chain of pointers.

Schematron

\[
\text{\textless sch:rule context="tei:*[not(self::tei:schemaSpec)][@targetLang]"\rangle}
\]
\[
\text{\textless sch:assert test="@target">@targetLang should only be used on \textless sch:name/\rangle if @target is specified.\textgreater \textless sch:assert \rangle \textless \textgreater \textless sch:rule\rangle}
\]

**att.resourced** provides attributes by which a resource (such as an externally held media file) may be located.

*Module* tei

*Members* graphic

*Attributes*

- **@url** (uniform resource locator) specifies the URL from which the media concerned may be obtained.
  
  *Status* Required
  
  *Datatype* teidata.pointer

**att.segLike** provides attributes for elements used for arbitrary segmentation. [17.3. Blocks, Segments, and Anchors] [18.1. Linguistic Segment Categories]

*Module* tei

*Members* c pc s seg w

*Attributes*

- **att.metrical**
  
  - @rhyme

- **att.fragmentable**
  
  - @part

*@function* (function) characterizes the function of the segment.

  *Status* Optional

  *Datatype* teidata.enumerated

*Note* Attribute values will often vary depending on the type of element to which they are attached. For example, a `<cl>`, may take values such as coordinate, subject, adverbial etc. For a `<phr>`, such values as subject, predicate etc. may be more appropriate. Such constraints will typically be implemented by a project-defined customization.

**att.sortable** provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [10.1. Dictionary Body and Overall Structure]

*Module* tei

*Members* bibl biblFull idno item list listBibl listChange listPerson listPlace person place term

*Attributes*

- **@sortKey** supplies the sort key for this element in an index, list or group which contains it.

  *Status* Optional
Datatype `teidata.word`

David’s other principal backer, Josiah ha-Kohen <index indexName="NAMES">
<term sortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</term>
</index> b. Azarya, son of one of the last gaons of Sura was David’s own first cousin.

**Note** The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produce the desired order; specifics of sort key construction are application-dependent. Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under fourth, and McCoy may be alphabetized under maccioy, while A1, A4, and A5 may all appear in numeric order alphabetized between a- and AA. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.

**att.spanning** provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [12.3.1.4. Additions and Deletions](#12.3.1.4. Additions and Deletions)

**Attribute Classes**

**Module** tei

**Members** ch lb milestone pb

**Attributes**

@spanTo indicates the end of a span initiated by the element bearing this attribute.

*Status* Optional

**Datatype** `teidata.pointer`

**Schematron** The @spanTo attribute must point to an element following the current element `<sch:rule context="tei::*[@spanTo]">`<sch:assert test="id(substring(@spanTo,2)) and following::*[@xml:id=substring(current()/@spanTo,2)]">The element indicated by @spanTo (<sch:value-of select="@spanTo"/>) must follow the current element `<sch:name/>`</sch:assert></sch:rule>

The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the spanTo attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.

**att.styleDef** provides attributes to specify the name of a formal definition language used to provide formatting or rendition information.

**Module** tei

**Members** rendition

**Attributes**
@scheme identifies the language used to describe the rendition.

**Status** Optional

**Datatype** teidata.enumerated

**Legal values are:**

- css Cascading Stylesheet Language
- xslfo Extensible Stylesheet Language Formatting Objects
- free Informal free text description
- other A user-defined rendition description language

**Note** If no value for the @scheme attribute is provided, then the default assumption should be that CSS is in use.

@schemeVersion supplies a version number for the style language provided in scheme.

**Status** Optional

**Datatype** teidata.versionNumber

**Schematron**

<sch:rule context="tei:*[@schemeVersion]">
  <sch:assert test="@scheme and not(@scheme = 'free')">
    @schemeVersion can only be used if @scheme is specified.
  </sch:assert>
</sch:rule>

**Note** If schemeVersion is used, then scheme should also appear, with a value other than free.

---

att.timed provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [§8.3.5. Temporal Information](#)

**Module** tei

**Members** gap

**Attributes**

- @start indicates the location within a temporal alignment at which this element begins.

  **Status** Optional

  **Datatype** teidata.pointer

  **Note** If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.

- @end indicates the location within a temporal alignment at which this element ends.

  **Status** Optional

  **Datatype** teidata.pointer

  **Note** If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.

---

att.transcriptional provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [§12.3.1.4. Additions and Deletions](#)

**Module** tei

**Members** add del subst

**Attributes** • att.editLike
• **att.written**
  
  — *@hand*

**@status** indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.

**Status** Optional

**Datatype** `teidata.enumerated`

_Sample values include:_

- **duplicate** all of the text indicated as an addition duplicates some text that is in the original, whether the duplication is word-for-word or less exact.

- **duplicate-partial** part of the text indicated as an addition duplicates some text that is in the original

- **excessStart** some text at the beginning of the deletion is marked as deleted even though it clearly should not be deleted.

- **excessEnd** some text at the end of the deletion is marked as deleted even though it clearly should not be deleted.

- **shortStart** some text at the beginning of the deletion is not marked as deleted even though it clearly should be.

- **shortEnd** some text at the end of the deletion is not marked as deleted even though it clearly should be.

- **partial** some text in the deletion is not marked as deleted even though it clearly should be.

- **unremarkable** the deletion is not faulty. [Default]

**Note** Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common. Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.

**@cause** documents the presumed cause for the intervention.

**Status** Optional

**Datatype** `teidata.enumerated`

**@seq** (sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.

**Status** Optional

**Datatype** `teidata.count`

---

**att.typed** provides attributes that can be used to classify or subclassify elements in any way. [1.3.1. Attribute Classes](#18.1.1.) [Words and Above](#3.6.1.) [Referring Strings](#3.7.) [Simple Links and Cross-References](#3.6.5.) [Abbreviations and Their Expansions](#3.13.1.) [Core Tags for Verse](#7.2.5.) [Speech Contents](#4.1.1.) [Un-numbered Divisions](#4.1.2.) Attributes

@type characterizes the element in some sense, using any convenient classification scheme or typology.

Status Optional

Datatype teidata.enumerated

Note The type attribute is present on a number of elements, not all of which are members of att.typed, usually because these elements restrict the possible values for the attribute in a specific way.

@subtype (subtype) provides a sub-categorization of the element, if needed

Status Optional

Datatype teidata.enumerated

Note The subtype attribute may be used to provide any sub-classification for the element additional to that provided by its type attribute.

Schematron <sch:rule context="tei:*[@subtype]"> <sch:assert test=""@type">The element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert> </sch:rule>

Note When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <valList> element in the project-specific schema description, as described in 24.3.1.3. Modification of Attribute and Attribute Value Lists.

att.written provides attributes to indicate the hand in which the content of an element was written in the source being transcribed. [1.3.1. Attribute Classes]

Module tei

Members att.transcriptional add del subst ab closer div figure fw g head hi label note opener p postscript salute seg signed stage text trailer zone

Attributes

@hand points to a <handNote> element describing the hand considered responsible for the content of the element concerned.
17.4 Macros

**macro.abContent** (anonymous block content) defines the content of anonymous block elements. [1.3. The TEI Class System]

*Module* tei

*Used by* ab

*Content model*

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <TextNode/>

</content>
```
macro.phraseSeq.limited = ( text | model.limitedPhrase | model.global )*

**macro.specialPara** ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]

**Module** tei

**Used by** cell, change, item, licence, note, q, quote, stage

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <TextNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>
    <classRef key="model.divPart"/>
    <classRef key="model.global"/>
  </alternate>
</content>
```

**Declaration**

```plaintext
macro.specialPara =
  ( text
    | model.gLike
    | model.phrase
    | model.inter
    | model.divPart
  | model.global )*
```

**macro.xtext** (extended text) defines a sequence of character data and gaiji elements.

**Module** tei

**Used by** c, mapping

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <TextNode/>
    <classRef key="model.gLike"/>
  </alternate>
</content>
```

**Declaration**

```plaintext
macro.xtext = ( text | model.gLike )*
```

**17.5 Datatypes**

teidata.certainty defines the range of attribute values expressing a degree of certainty.
**Module** tei

**Used by** teidata.probCert

**Content model**

```xml
<content>
  <valList type="closed">
    <valItem ident="high"/>
    <valItem ident="medium"/>
    <valItem ident="low"/>
    <valItem ident="unknown"/>
  </valList>
</content>
```

**Declaration**

```
teidata.certainty = "high" | "medium" | "low" | "unknown"
```

**Note** Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

---

**teidata.count** defines the range of attribute values used for a non-negative integer value used as a count.

**Module** tei

**Used by** Element:

- `table/@rows`
- `table/@cols`
- `tagUsage/@occurs`
- `tagUsage/@withId`
- `zone/@rotate`

**Content model**

```xml
<content>
  <dataRef name="nonNegativeInteger"/>
</content>
```

**Declaration**

```
teidata.count = xsd:nonNegativeInteger
```

**Note** Any positive integer value or zero is permitted.

---

**teidata.duration.iso** defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats.

**Module** tei

**Used by**

**Content model**

```xml
<content>
  <dataRef name="token"
             restriction="[0-9.,DHMPRSTWYZ/:\-]+"/>
</content>
```
Declaration

```xml
teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }```

Example

```xml
<time dur-iso="PT0.75H">three-quarters of an hour</time>
```

Example

```xml
<date dur-iso="P1,5D">a day and a half</date>
```

Example

```xml
<date dur-iso="P14D">a fortnight</date>
```

Example

```xml
<time dur-iso="PT0.02S">20 ms</time>
```

Note  A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see ISO 8601 Data elements and interchange formats — Information interchange — Representation of dates and times.

---

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.

Module  tei

Used by

Content model  ```xml
<content> <dataRef name="duration"/></content>
```

Declaration  ```xml
teidata.duration.w3c = xsd:duration
```

Example

```xml
<time dur="PT45M">forty-five minutes</time>
```

Example

```xml
<date dur="P1DT12H">a day and a half</date>
```

Example

```xml
<date dur="P7D">a week</date>
```

Example

```xml
<time dur="PT0.02S">20 ms</time>
```

Note  A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except
for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see the W3C specification.

teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

Module tei

Used by

teidata.gender
teidata.sex

Element:

• abbr/@type
• availability/@status
• castItem/@type
• cell/@role
• desc/@type
• formula/@notation
• fw/@type
• gap/@reason
• gap/@agent
• idno/@type
• list/@type
• measure/@type
• name/@type
• num/@type
• pc/@force
• pc/@unit
• person/@role
• person/@age
• q/@type
• rendition/@scope
• row/@role
• stage/@type
• surface/@attachment
• title/@type
• title/@level
• titlePage/@type
• titlePart/@type
• unclear/@reason
• unclear/@agent

Content model

<content> <dataRef key="teidata.word"/></content>
teidata.gender defines the range of attribute values used to represent the gender of a person, persona, or character.

Module tei

Used by Element:
- actor/@gender
- person/@gender
- role/@gender

Content model

```
<content>
  <dataRef key="teidata.enumerated"/>
</content>
```

Declaration \texttt{teidata.gender = teidata.enumerated}

Note Values for attributes using this datatype may be defined locally by a project, or they may refer to an external standard.

Values for this datatype should not be used to encode morphological gender (cf. \texttt{<gen>}, \texttt{msd} as defined in \texttt{att.linguistic} and \ref{section:10.3.1 Information on Written and Spoken Forms}).

---

teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. \ref{section:6.1 Language Identification}

Module tei

Used by Element:
- language/@ident

Content model

```
<content>
  <alternate>
    <dataRef name="language"/>
    <valList>
      <valItem ident=""/>
    </valList>
  </alternate>
</content>
```

Declaration \texttt{teidata.language = xsd:language | ( "" )}

Note The values for this attribute are language tags as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.
A language tag, per BCP 47, is assembled from a sequence of components or subtags separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

**language** The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at https://www.iana.org/assignments/language-subtag-registry. It is recommended that this code be written in lower case.

**script** The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at https://unicode.org/iso15924/iso15924-codes.html. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

**region** Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at https://www.iso.org/obp/ui/#search/code/. The latter consist of 3 digits; the list of codes can be found at http://unstats.un.org/unsd/methods/m49/m49.htm.

**variant** An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.

**extension** An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

**private use** An extension that uses the initial subtag of the single letter x (i.e., starts with x-) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding `<language>` element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been grandfathered from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with x-, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding `<language>` element in the TEI header.

Examples include

- **sn** Shona
- **zh-TW** Taiwanese
teidata.name defines the range of attribute values expressed as an XML Name.

Module tei
Used by Element:
- `@gi`

Content model:
```
<content> <dataRef name="Name"/></content>
```

Declaration:  `teidata.name = xsd:Name`

Note: Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see [https://www.w3.org/TR/REC-xml/#dt-name](https://www.w3.org/TR/REC-xml/#dt-name)): for example they cannot include whitespace or begin with digits.

---

teidata.namespace defines the range of attribute values used to indicate XML namespaces as defined by the W3C Namespaces in XML Technical Recommendation.

Module tei
Used by Element:
- `@name`

Content model:
```
<content>
<dataRef restriction="%S+" name="anyURI"/>
</content>
```

Declaration:  `teidata.namespace = xsd:anyURI { pattern = "%S+" }`

Note: The range of syntactically valid values is defined by [RFC 3986 Uniform Resource Identifier (URI): Generic Syntax](https://www.rfc-editor.org/rfc/rfc3986).

---

teidata.numeric defines the range of attribute values used for numeric values.

Module tei
Used by Element:
- `@value`

Content model:
```
<content>
<alternate>
469
</content>
```
Declaration

```xml
<dataRef name="double"/>
<dataRef name="token"
  restriction="(-?\d+/\-?\d+)"/>
<dataRef name="decimal"/>
</alternate>
</content>
```

**Note** Any numeric value, represented as a decimal number, in floating point format, or as a ratio.

To represent a floating point number, expressed in scientific notation, E notation, a variant of exponential notation, may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.

A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string $1/2$.

---

**teidata.outputMeasurement** defines a range of values for use in specifying the size of an object that is intended for display.

**Module** tei

**Used by**

**Content model**

```xml
<content>
  <dataRef name="token"
    restriction="[-+]?\d+(\.\d+)?(\%|cm|mm|in|pt|pc|px|em|ex|ch|rem|vw|vh|vmin|vmax)"/>
</content>
```

**Declaration**

```xml
teidata.outputMeasurement =
  token
  { pattern = "[-+]?\d+(\.\d+)?(\%|cm|mm|in|pt|pc|px|em|ex|ch|rem|vw|vh|vmin|vmax)" }
```

**Example**

```xml
<figure>
  <head>The TEI Logo</head>

</figure>
```
teidata.pattern defines attribute values which are expressed as a regular expression.

*Module* tei

*Used by*

*Content model*

```
<content> <dataRef name="token"/></content>
```

*Declaration*

```
teidata.pattern = token
```

*Note* A regular expression, often called a *pattern*, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings *Handel*, *Händel*, and *Haendel* can be described by the pattern H(ä|ae?)ndel (or alternatively, it is said that the pattern H(ä|ae?)ndel matches each of the three strings). Wikipedia

This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.

teidata.point defines the data type used to express a point in cartesian space.

*Module* tei

*Used by*

*Content model*

```
<content>
 <dataRef name="token"
</content>
```

*Declaration*

```
```

*Example*

```
<facsimile>
 <surface ulx="0" uly="0" lrx="400" lry="280">
   <zone points="220,100 300,210 170,250 123,234">
     <graphic url="handwriting.png"/>
   </zone>
 </surface>
</facsimile>
```
Note A point is defined by two numeric values, which should be expressed as decimal numbers. Neither number can end in a decimal point. E.g., both 0.0,84.2 and 0,84 are allowed, but 0.,84. is not.

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei

Used by Element:

- author/@calendar
- catRef/@scheme
- change/@calendar
- change/@target
- classCode/@scheme
- creation/@calendar
- editor/@calendar
- g/@ref
- idno/@calendar
- keywords/@scheme
- licence/@calendar
- name/@calendar
- relatedItem/@target
- resp/@calendar
- title/@calendar

Content model

```xml
<content>
<dataRef restriction="\S+" name="anyURI"/>
</content>
```

Declaration teidata.pointer = xsd:anyURI { pattern = "\S+" }

Note The range of syntactically valid values is defined by RFC 3986 Uniform Resource Identifier (URI): Generic Syntax. Note that the values themselves are encoded using RFC 3987 Internationalized Resource Identifiers (IRIs) mapping to URIs. For example, https://secure.wikimedia.org/wikipedia/en/wiki/% is encoded as https://secure.wikimedia.org/wikipedia/en/wiki/%25 while http://موقع.وزارة-الاتصالات.مصر is encoded as http://xn--4gbirim.xn----rmckbbajlc6dj7bxne2c.xn--wgbh1c/

teidata.prefix defines a range of values that may function as a URI scheme name.

Module tei

Used by Element:

- prefixDef/@ident
Content model

```xml
<content>
  <dataRef name="token"
    restriction="[a-z][a-z0-9\.-\-]*"/>
</content>
```

Declaration

```xml
teidata.prefix = token { pattern = "[a-z][a-z0-9\.-\-]*" }
```

Note This datatype is used to constrain a string of characters to one that can be used as a URI scheme name according to RFC 3986, section 3.1. Thus only the 26 lowercase letters a–z, the 10 digits 0–9, the plus sign, the period, and the hyphen are permitted, and the value must start with a letter.

**teidata.probCert** defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

*Module* tei

*Used by* teidata.probCert

Content model

```xml
<content>
  <alternate>
    <dataRef key="teidata.probability"/>
    <dataRef key="teidata.certainty"/>
  </alternate>
</content>
```

Declaration

```xml
teidata.probCert = teidata.probability | teidata.certainty
```

**teidata.probability** defines the range of attribute values expressing a probability.

*Module* tei

*Used by* teidata.probCert

Content model

```xml
<content>
  <dataRef name="double">
    <dataFacet name="minInclusive" value="0"/>
    <dataFacet name="maxInclusive" value="1"/>
  </dataRef>
</content>
```

Declaration

```xml
teidata.probability = xsd:double
```

Note Probability is expressed as a real number between 0 and 1; 0 representing *certainly false* and 1 representing *certainly true*.
teidata.replacement defines attribute values which contain a replacement template.

Module: tei
Used by:

Content model: `<content> <textNode/></content>`

Declaration: `teidata.replacement = text`

---

teidata.sex defines the range of attribute values used to identify the sex of an organism.

Module: tei
Used by: Element:
- actor/@sex
- person/@sex

Content model:
```
<content>
<dataRef key="teidata.enumerated"/>
</content>
```

Declaration: `teidata.sex = teidata.enumerated`

Note: Values for attributes using this datatype may be defined locally by a project, or they may refer to an external standard.

---

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

Module: tei
Used by:

Content model:
```
<content>
<alternate>
<dataRef name="date"/>
<dataRef name="gYear"/>
<dataRef name="gMonth"/>
<dataRef name="gDay"/>
<dataRef name="gYearMonth"/>
<dataRef name="gMonthDay"/>
<dataRef name="time"/>
<dataRef name="dateTime"/>
</alternate>
</content>
```

Declaration:
```
teidata.temporal.w3c =
    xsd:date
    | xsd:gYear
    | xsd:gMonth
```
teidata.text  defines the range of attribute values used to express some kind of identifying string as a single sequence of Unicode characters possibly including whitespace.

Module  tei
Used by  Element:
  • rendition/@selector
  • unicodeProp/@value

Content model  
<content> <dataRef name="string"/></content>

Declaration  
```xml
teidata.text = string
```
Note  Attributes using this datatype must contain a single token in which whitespace and other punctuation characters are permitted.

teidata.truthValue  defines the range of attribute values used to express a truth value.

Module  tei
Used by  Element:
  • listChange/@ordered
  • pc/@pre
  • surface/@flipping
  • tagsDecl/@partial

Content model  
<content> <dataRef name="boolean"/></content>

Declaration  
```xml
teidata.truthValue = xsd:boolean
```
Note  The possible values of this datatype are 1 or true, or 0 or false.
This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: teidata.xTruthValue.

teidata.version  defines the range of attribute values which may be used to specify a TEI or Unicode version number.

Module  tei
Used by  Element:
  • teiCorpus/@version

Note  If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[\d]+(\.[\d]+){0,2}"/>
</content>
```

Declaration

```xml
teidata.version = token { pattern = "[\d]+(\.[\d]+){0,2}" }
```

Note The value of this attribute follows the pattern specified by the Unicode consortium for its version number ([https://unicode.org/versions/](https://unicode.org/versions/)). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.

teidata.versionNumber defines the range of attribute values used for version numbers.

Module tei

Used by

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[\d]+[a-z]*[\d]*\.[\d]+[a-z]*[\d]*\{0,3}\"
></content>
```

Declaration

```xml
teidata.versionNumber =
  token { pattern = "[\d]+[a-z]*[\d]*\.[\d]+[a-z]*[\d]*\{0,3}\"
```

-teidata.word defines the range of attribute values expressed as a single word or token.

Module tei

Used by teidata.enumerated

Element:

- `code/@lang`
- `rhyme/@label`
- `supplied/@reason`
- `unihanProp/@value`

Content model

```xml
<content>
  <dataRef name="token"
    restriction="[^\p{C}\p{Z}]+"/>
</content>
```

Declaration

```xml
teidata.word = token { pattern = "[^\p{C}\p{Z}]+" }
```
**Note** Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

**teidata.xmlName** defines attribute values which contain an XML name.

*Module* tei

*Used by* Element:

- `unicodeProp/@name`
- `unihanProp/@name`

**Content model** `<content> <dataRef name="NCName"/></content>`

**Declaration** `teidata.xmlName = xsd:NCName`

**Note** The rules defining an XML name form a part of the XML Specification.

**teidata.xpath** defines attribute values which contain an XPath expression.

*Module* tei

*Used by* Content model `<content> <textNode/></content>`

**Declaration** `teidata.xpath = text`

**Note** Any XPath expression using the syntax defined in 6.2.

When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.

17.6 Summary of changes

The TEI simplePrint schema uses the TEI infrastructure and gaiji modules unchanged.

*Module* tei

*Module* gaiji

A subset of 45 elements is selected from the TEI header module. In addition, elements `<particDesc>` and `<settingDesc>` are provided from the corpus module. The class membership of `<particDesc>` is changed to ensure that it can only appear inside `<profileDesc>`. Secondly, a Schematron rule is added to the `<text>` element to ensure that elements `<term>` and `<biblFull>` can appear only in the header element, even though the schema permits them additionally in text.

*Module* header

*Module* corpus

Some attributes and attribute classes are removed. The range of values available for several attributes is constrained.

<table>
<thead>
<tr>
<th>Class</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>att.datcat</td>
<td>delete</td>
</tr>
<tr>
<td>att.declarable</td>
<td>delete</td>
</tr>
<tr>
<td>att.declaring</td>
<td>delete</td>
</tr>
<tr>
<td>att.ranging</td>
<td>delete</td>
</tr>
<tr>
<td>att.global.linking</td>
<td>change</td>
</tr>
</tbody>
</table>
The following unused model classes are removed.

<table>
<thead>
<tr>
<th>Class</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>model.certLike</td>
<td>delete</td>
</tr>
<tr>
<td>model.egLike</td>
<td>delete</td>
</tr>
<tr>
<td>model.entryPart</td>
<td>delete</td>
</tr>
<tr>
<td>model.glossLike</td>
<td>delete</td>
</tr>
<tr>
<td>model.oddDecl</td>
<td>delete</td>
</tr>
<tr>
<td>model.offsetLike</td>
<td>delete</td>
</tr>
<tr>
<td>model.pPart.msdesc</td>
<td>delete</td>
</tr>
<tr>
<td>model.placeNamePart</td>
<td>delete</td>
</tr>
<tr>
<td>model.placeStateLike</td>
<td>delete</td>
</tr>
<tr>
<td>model.specDescLike</td>
<td>delete</td>
</tr>
</tbody>
</table>

The following elements are modified by the TEI simplePrint specification, mostly by the addition of a processing model, but in other cases by additional constraints on the attributes they may have, or the values those attributes may take. Additional examples are also provided for some of them.
